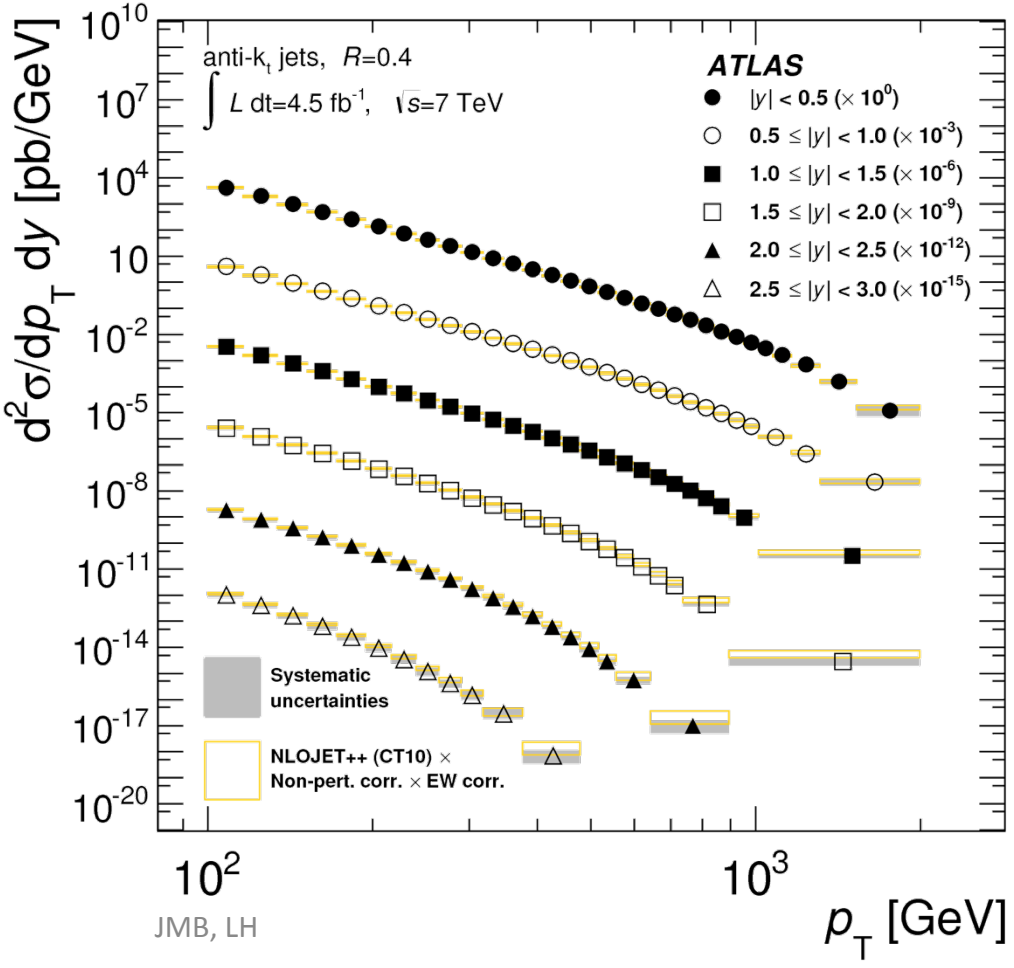
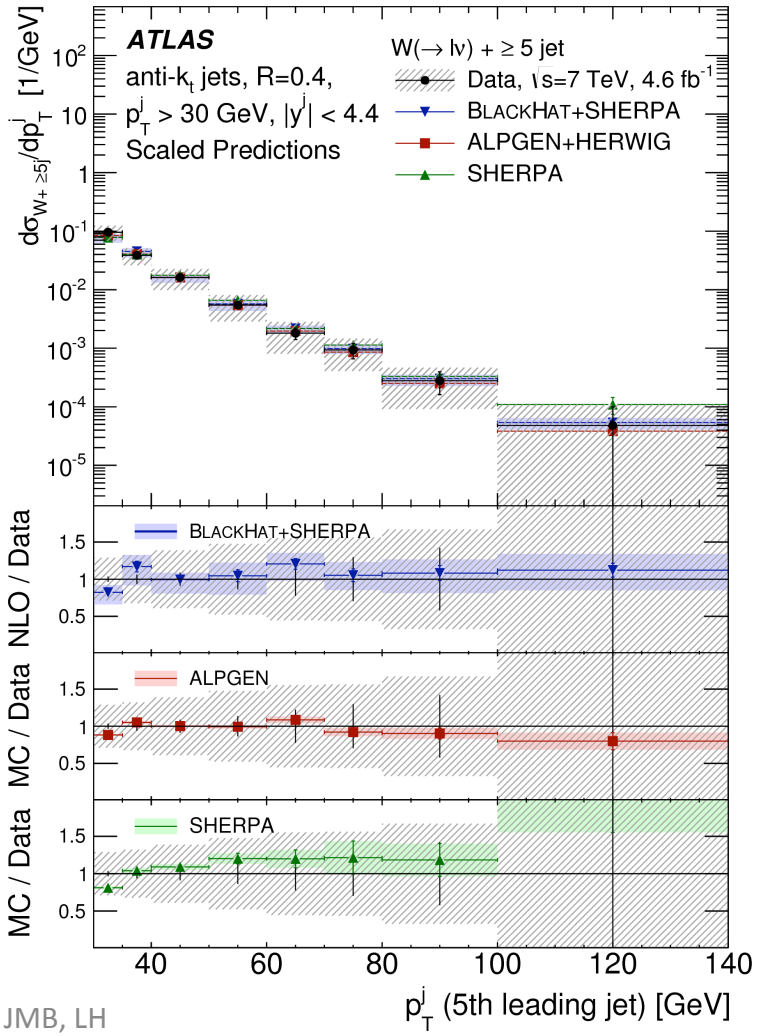
Precision ‘Standard Model’ Measurements

- They should not (and mostly do not) assume the SM
- They agree with the SM
- Thus they can potentially exclude extensions

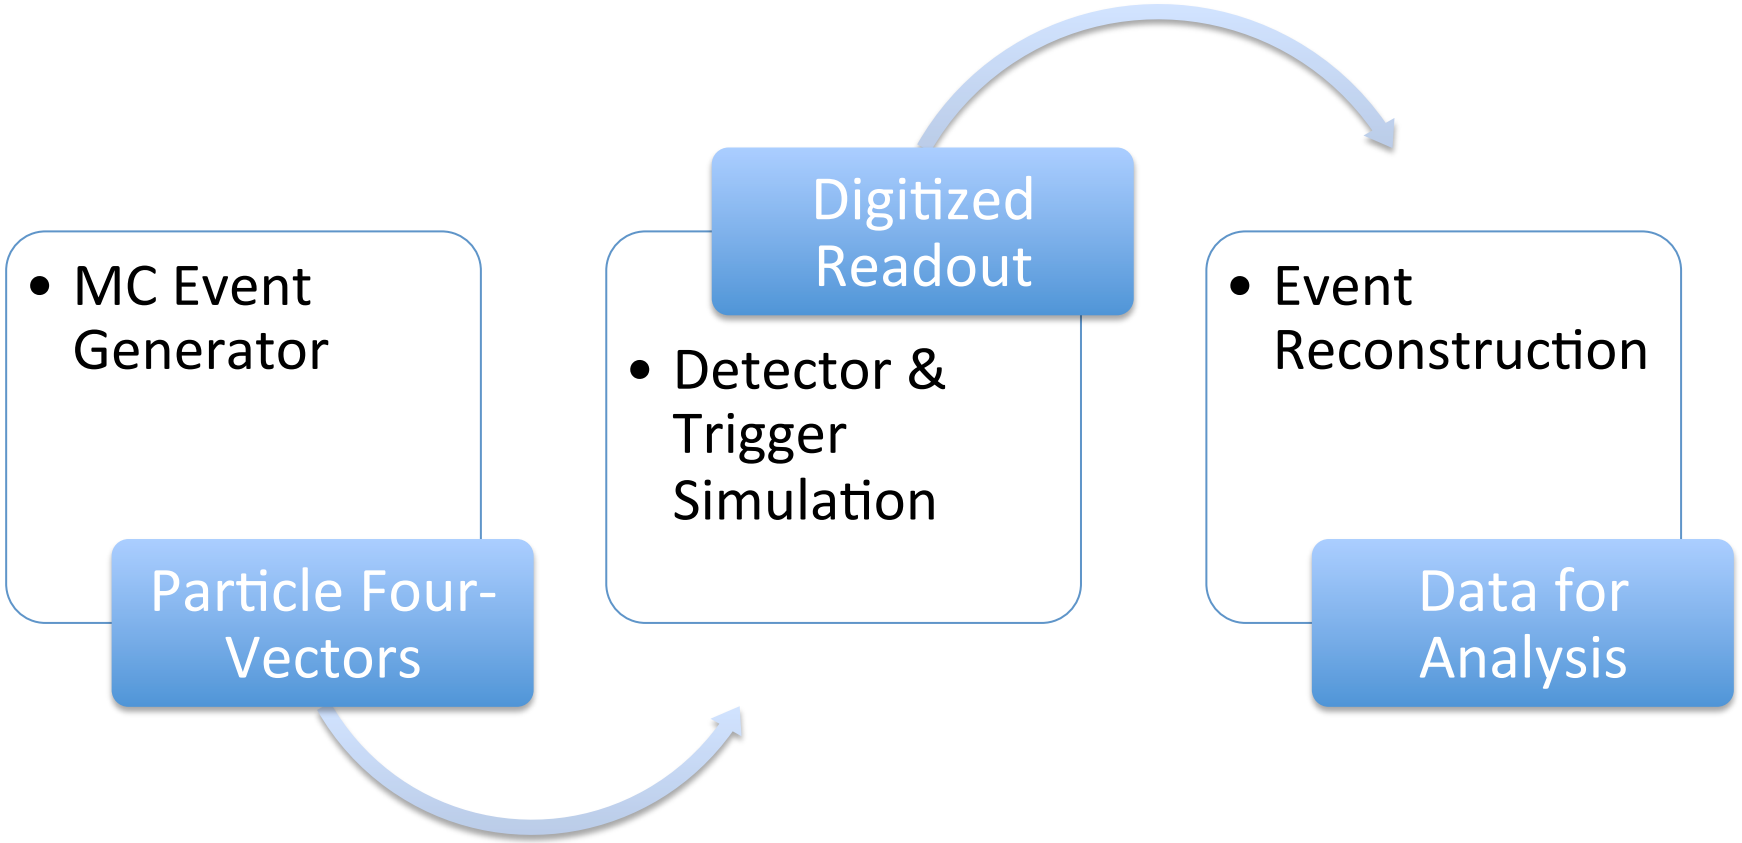


Precision 'Standard Model' Measurements

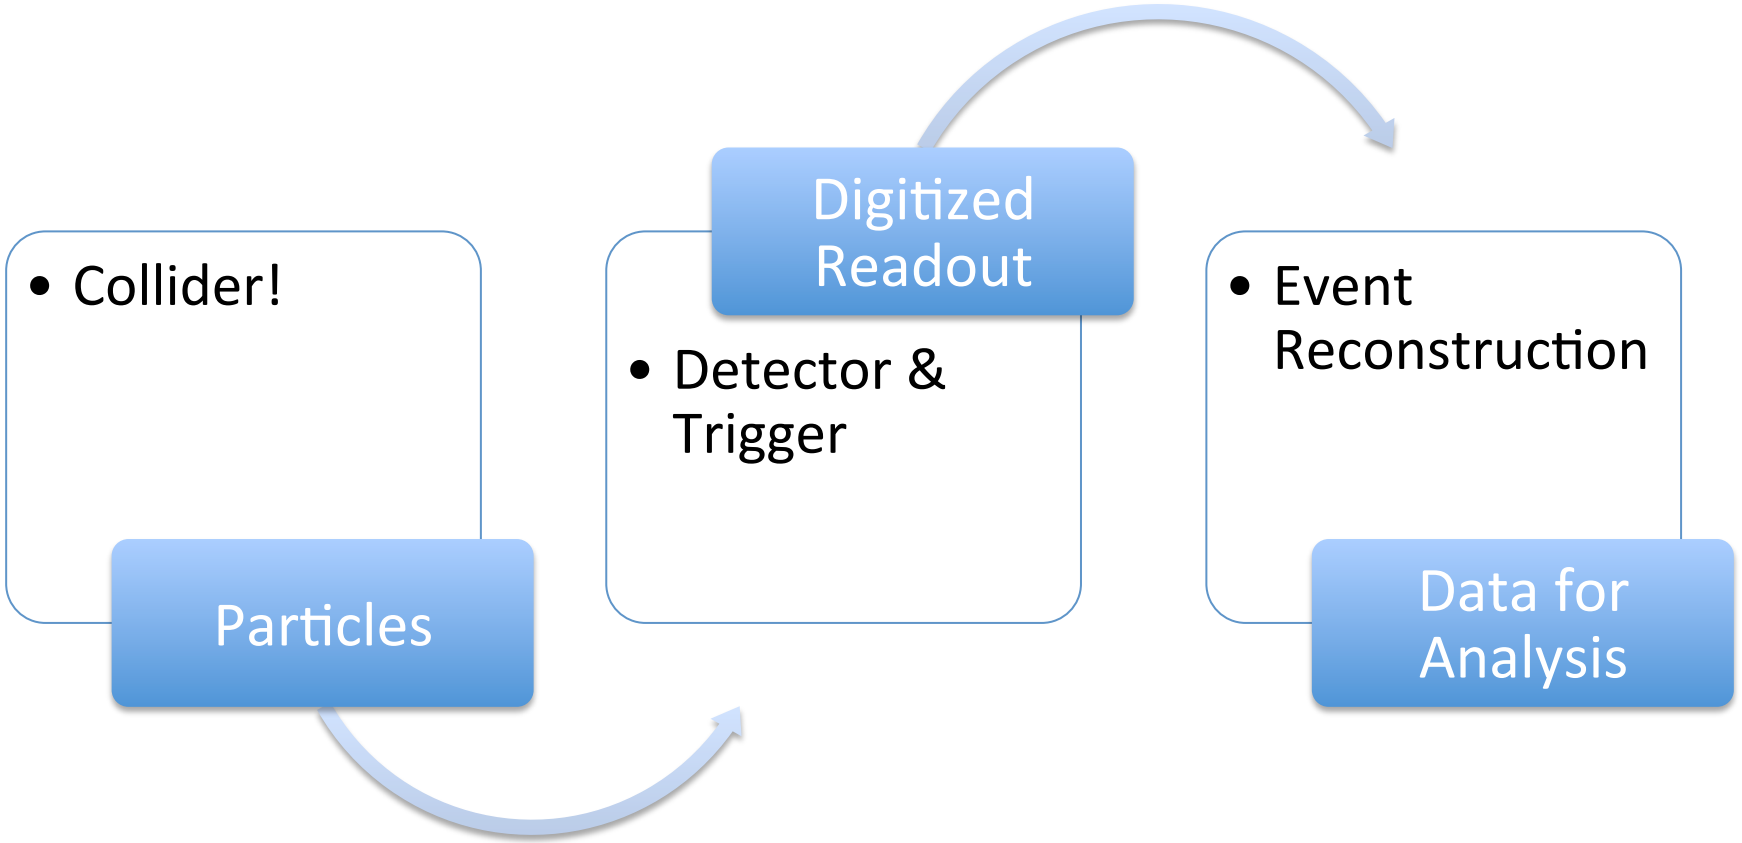
- They should not (and mostly do not) assume the SM
- They agree with the SM
- Thus they can potentially exclude extensions



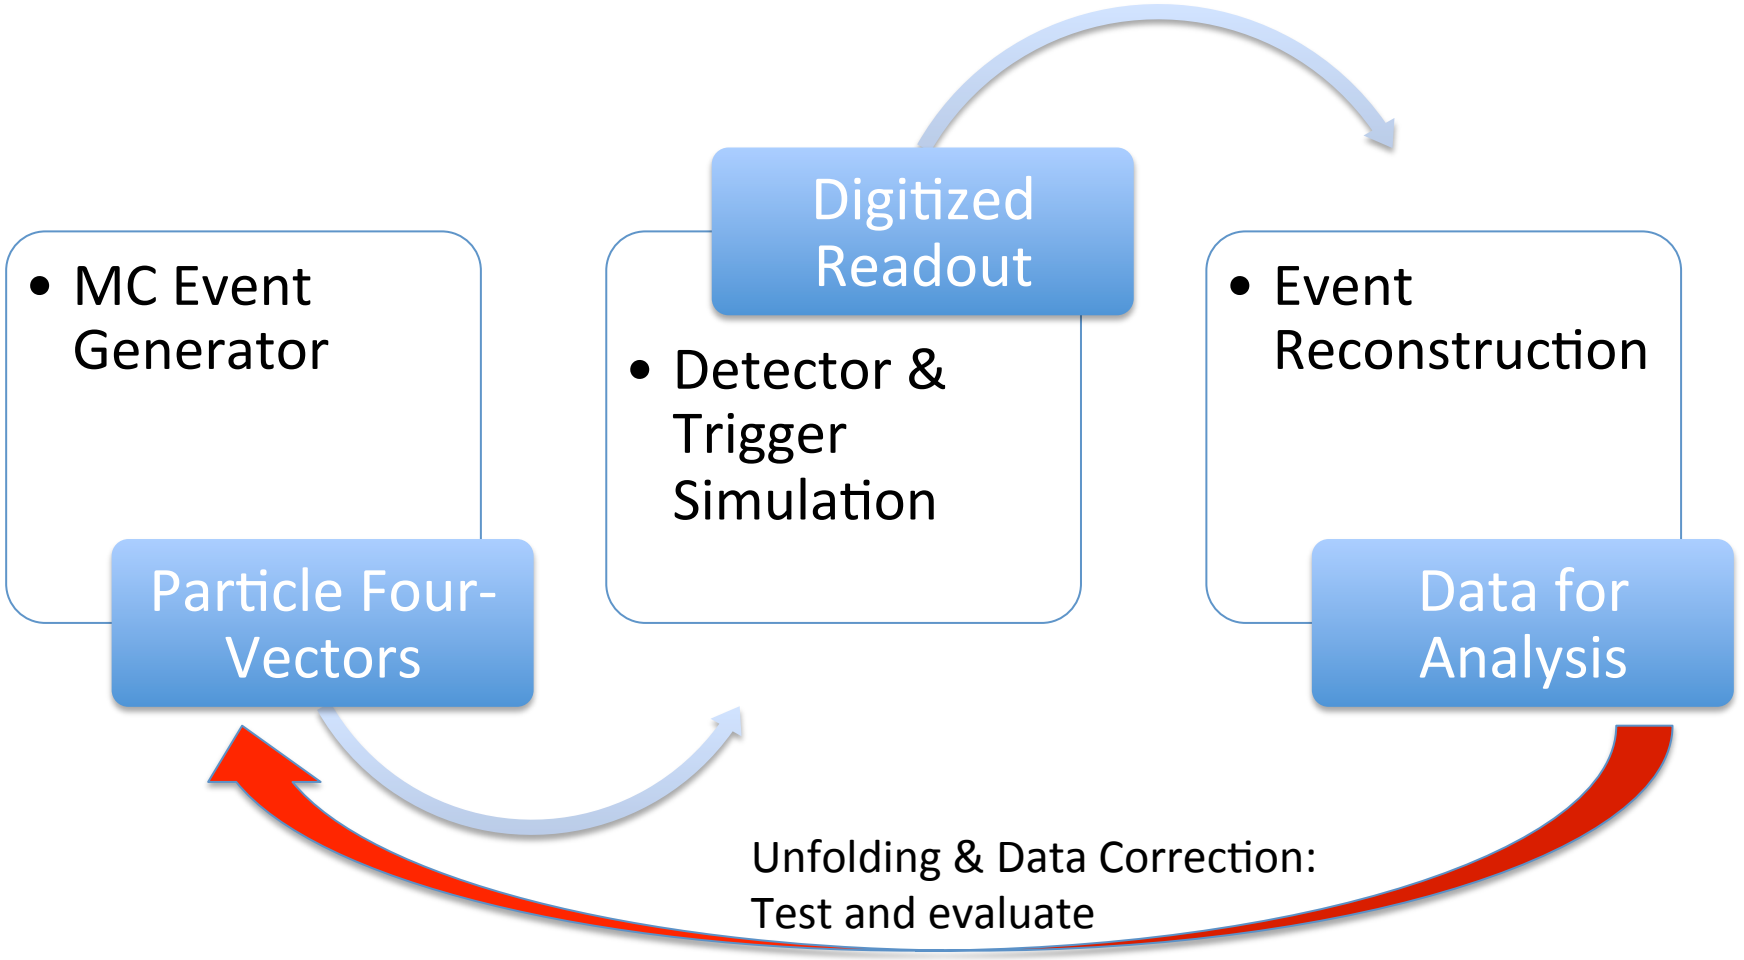
Simulation and Experiment



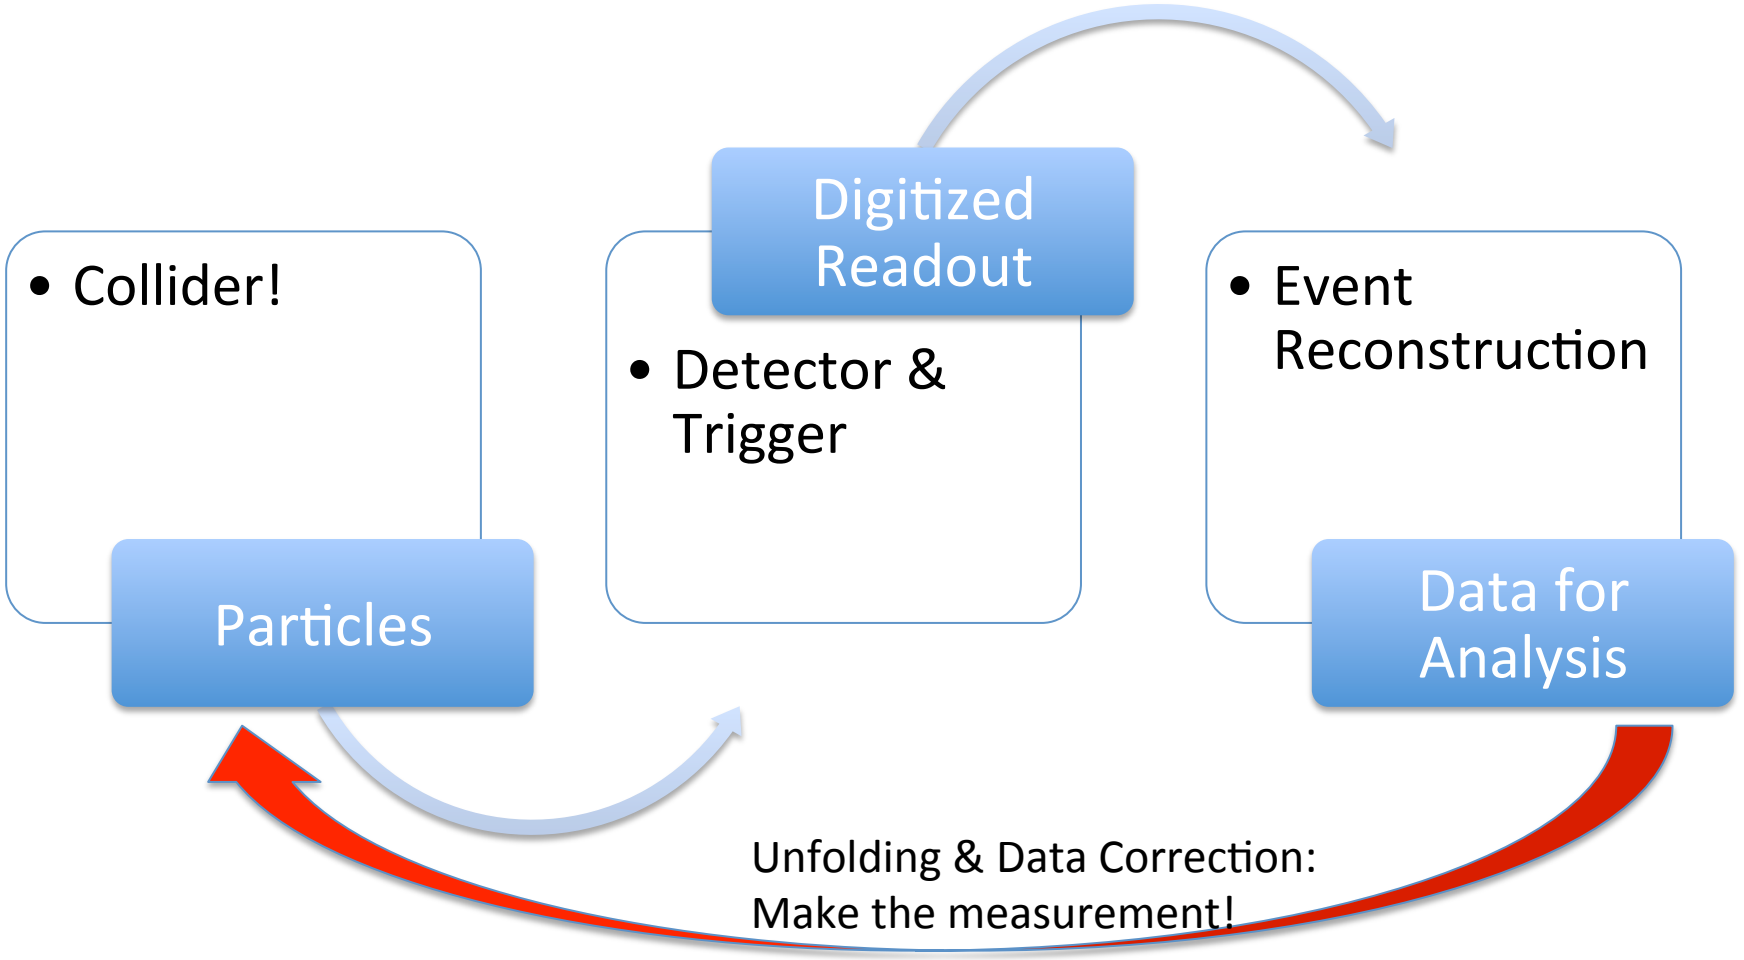
Simulation and Experiment



Simulation and Experiment



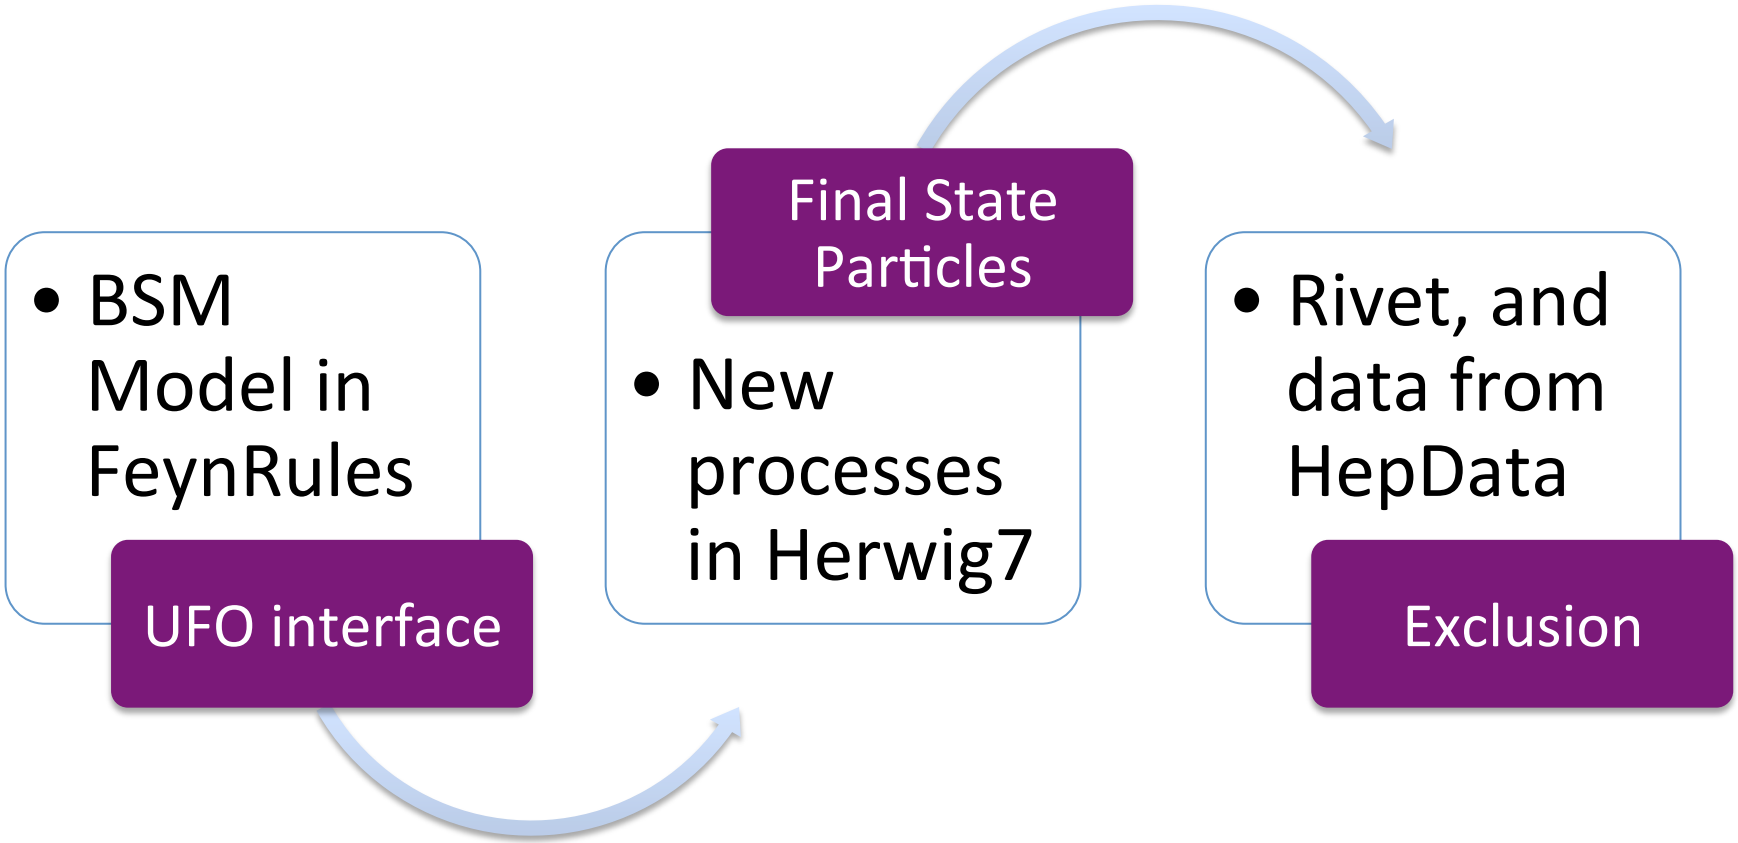
Simulation and Experiment



“Unfolding”

- Some people really don’t seem to like it…
- If the cross section is well-defined, unfolding and its uncertainties can be well-defined
  - Fiducial region, matches the experimental acceptance well
  - True final-state obects
- Both mandate simulation of the full final state

Key tools:

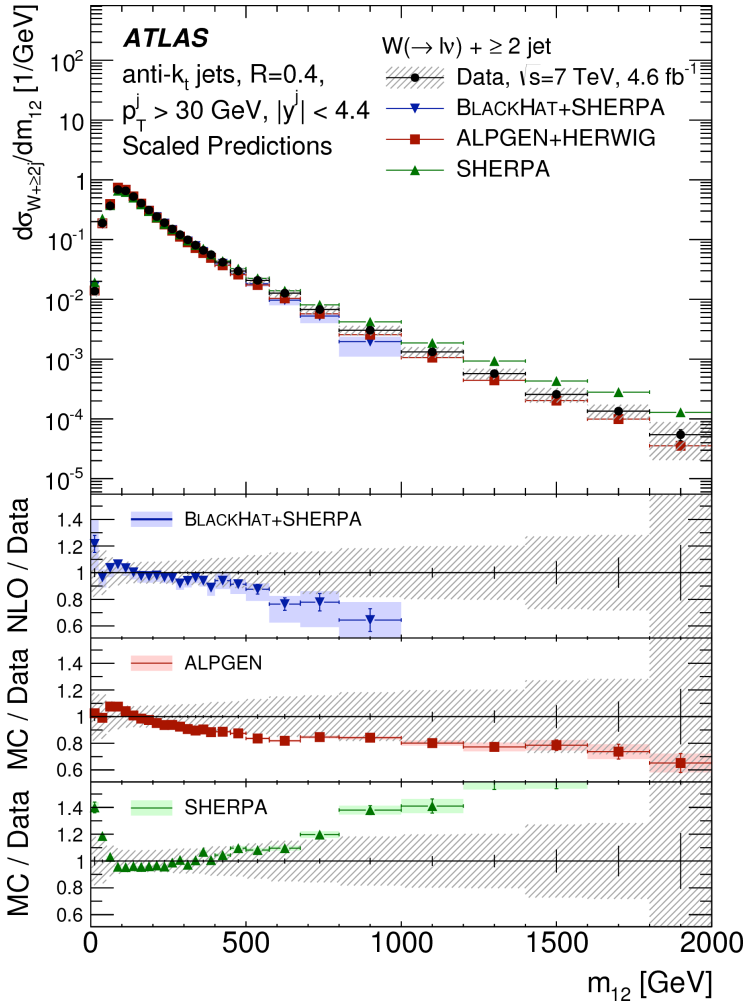


• BSM Model in FeynRules
UFO interface
Final State Particles
• New processes in Herwig7
• Rivet, and data from HepData
Exclusion

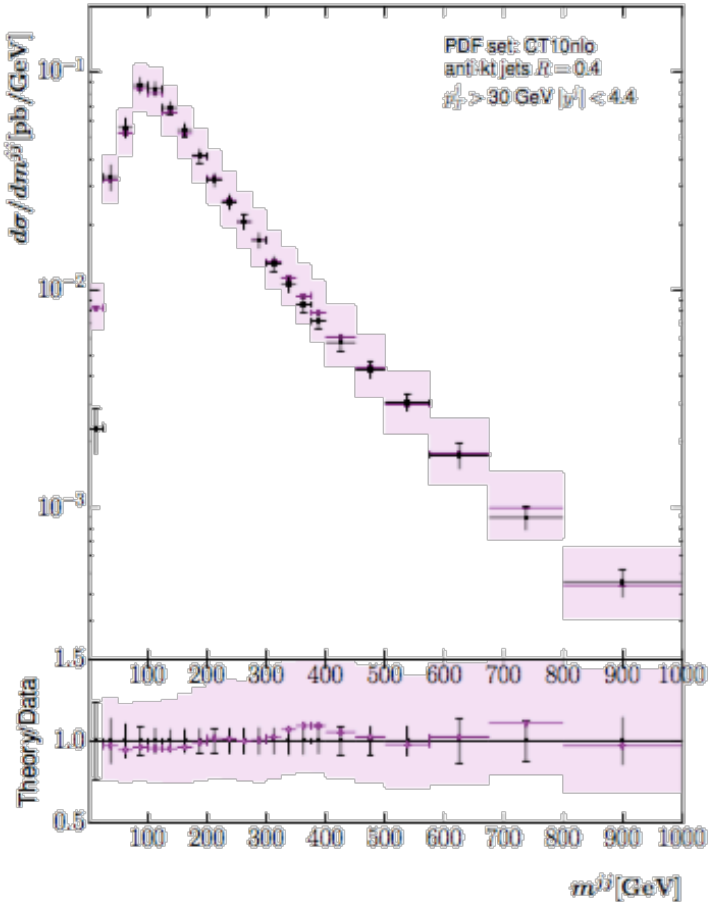
Strategy

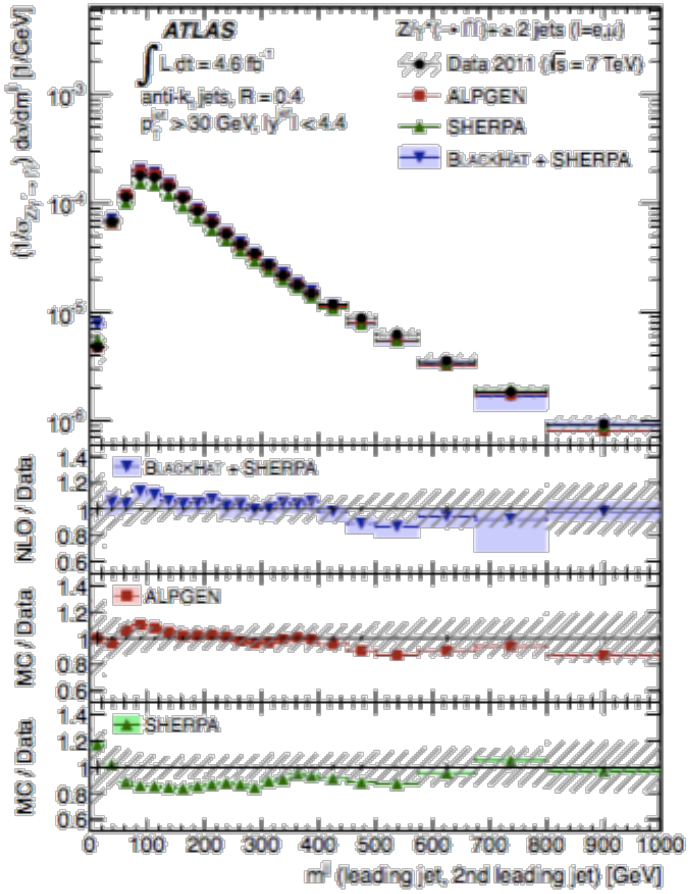
- Use measurements shown to agree with the Standard Model
  - Not a search! Guaranteed not to find anything
  - Measurements take longer, but more general and less model dependent
  - (Currently) assume the data = the background!

Will miss this kind of thing…



Although we probably want to miss it…





J. Andersen, J. J. Medley, J. M. Smillie, JHEP 1605 (2016) 136, arXiv:1603.05460 [hep-ph]

Strategy

- Use measurements shown to agree with the Standard Model
  - Not a search! Guaranteed not to find anything
  - Measurements take longer, but more general and less model dependent
  - (Currently) assume the data = the background!
- Key for constraining new models if there is a signal (unintended consequences)
- Key for constraining scale of new physics if there is no signal

Statistics

- Construct likelihood function using
  - BSM signal event count
  - Background count (from central value of data points)
  - Gaussian assumption on uncertainty in background count, from combination of statistical and systematic uncertainties
  - BSM signal count error from statistics of generated events (small!)
- Make profile likelihood ratio a la Cowan et al (Asimov data set approximation is valid)
- Present in CL_s method (A. Read)
- Systematic correlations not fully treated - take only the most significant deviation in a given plot (conservative)

Dynamic data selection

- SM measurements of fiducial, particle-level differential cross sections, with existing Rivet routines
- Classify according to data set (7, 8, 13 TeV) and into non-overlapping signatures
- Use only one plot from each given statistically correlated sample
- Jets, W+jets, Z+jets, γ (+jets), $\gamma\gamma$, ZZ, W/Z+γ
- Sadly no Missing E_T+jets, not much 8 TeV, no 13 TeV yet, though much is on the way… Also can use suitably model-independent Higgs and top measurements in future.
- Most sensitive measurement will vary with model and model parameters

Observations on the Rivet routines

- Interesting exercise in testing the assumptions made in the Rivet analysis.
  - Use of explicit neutrino particle codes (instead of missing ET)
  - Prompt/isolated leptons
  - Hidden vetos (not really inclusive?) not mentioned in fiducial phase space

CONTUR Category	Rivet/ Inspire ID	Rivet description
ATLAS 7 Jets	ATLAS_2014_I1325553 [28]	Measurement of the inclusive jet cross-section
	ATLAS_2014_I1268975 [30]	High-mass dijet cross section
	ATLAS_2014_I1326641 [32]	3-jet cross section
	ATLAS_2014_I1307243 [31]	Measurements of jet vetoes and azimuthal decorrelations in dijet events
CMS 7 Jets	CMS_2014_I1298810 [29]	Ratios of jet pT spectra, which relate to the ratios of inclusive, differential jet cross sections
ATLAS 8 Jets	ATLAS_2015_I1394679 [34]	Multijets at 8 TeV
ATLAS 7 Z Jets	ATLAS_2013_I1230812 [35]	Z + jets
CMS 7 Z Jets	CMS_2015_I1310737 [38]	Jet multiplicity and differential cross-sections of Z+jets events
CMS 7 W Jets	CMS_2014_I1303894 [37]	Differential cross-section of W bosons + jets
ATLAS W jets	ATLAS_2014_I1319490 [36]	W + jets
ATLAS 7 Photon Jet	ATLAS_2013_I1263495 [42]	Inclusive isolated prompt photon analysis with 2011 LHC data
	ATLAS_2012_I1093738 [44]	Isolated prompt photon + jet cross-section
CMS 7 Photon Jet	CMS_2014_I1266056 [45]	Photon + jets triple differential cross-section
ATLAS 7 Diphoton	ATLAS_2012_I1199269 [43]	Inclusive diphoton $+X$ events
ATLAS 7 ZZ	ATLAS_2012_I1203852 [39]	Measurement of the $ZZ(*)$ production cross-section
ATLAS W/Z gamma	ATLAS_2013_I1217863 [40]	W/Z gamma production

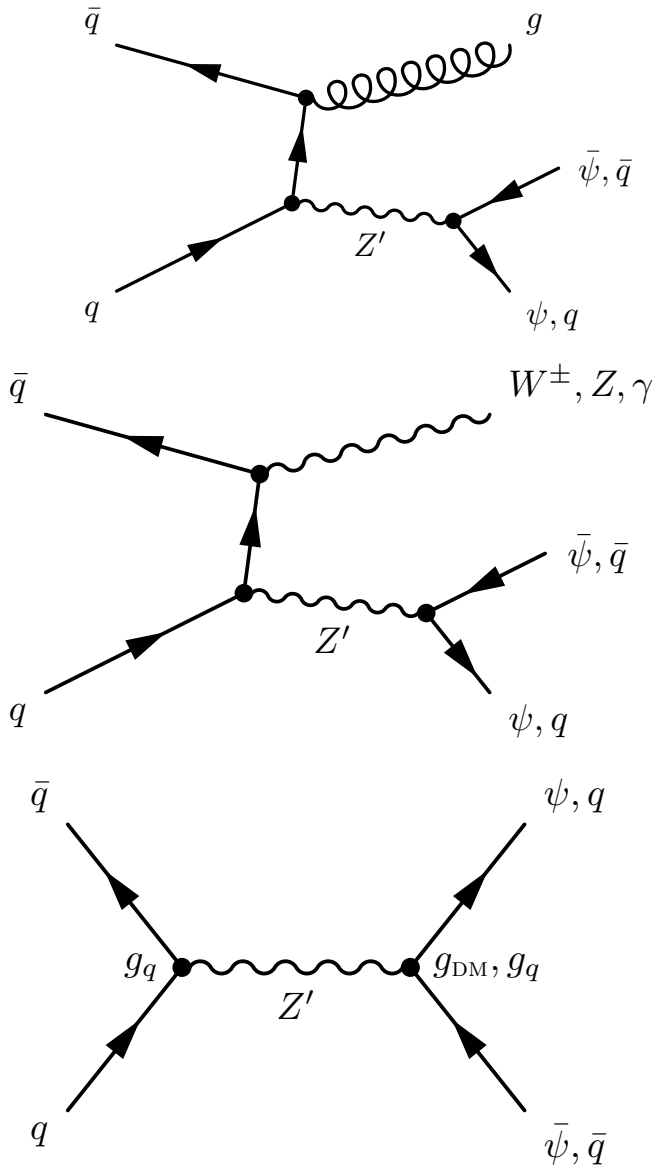
Simplified Model(s)

- Effective lagrangian including minimal new couplings *and* particles
- Our starter example: leptophobic Z' with vector coupling to u,d quarks, axial vector to a DM candidate ψ.

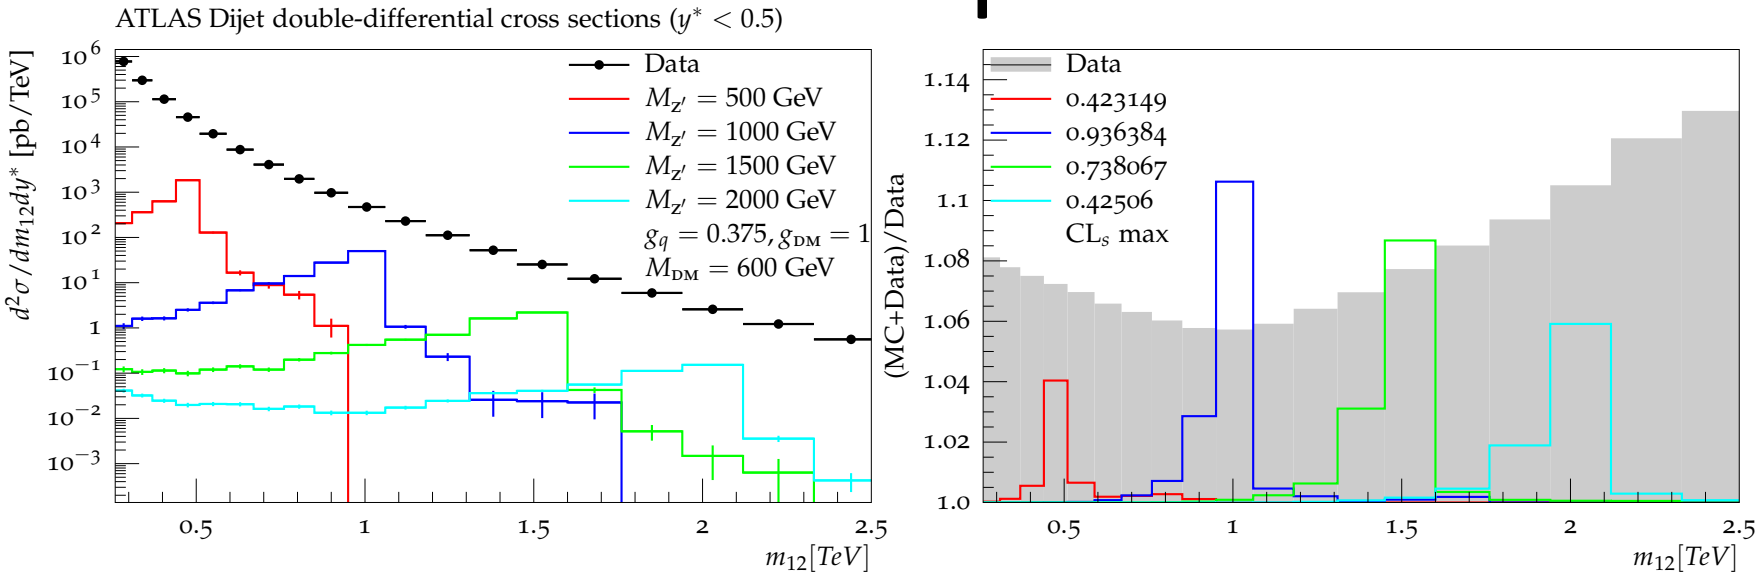
$$\mathcal{L} \supset g_{\mathrm{DM}}\,\overline{\psi}\gamma_\mu\gamma_5\psi\,Z'^\mu + g_q \sum_q \bar{q}\gamma_\mu q\,Z'^\mu$$

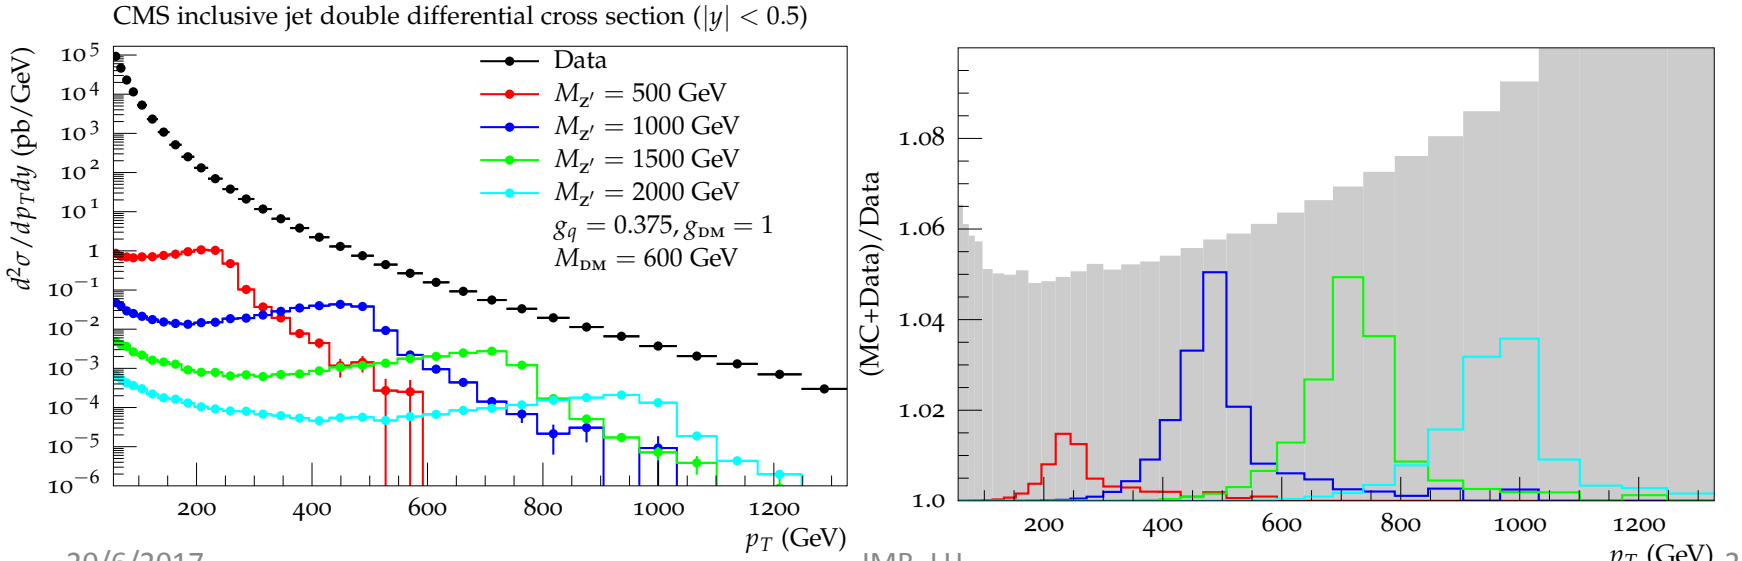


Parameter Choices

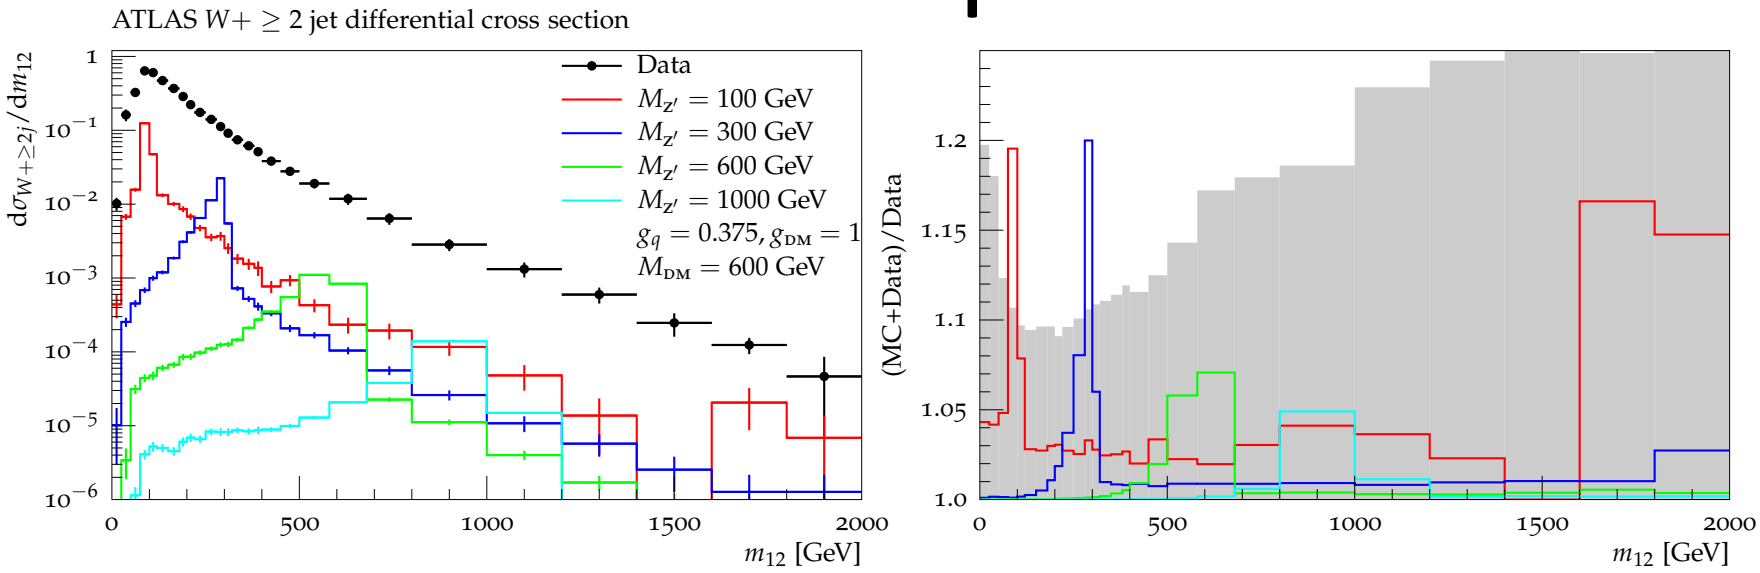
- Scan in M_{DM} and $M_{Z'}$
- Four pairs of couplings:
  - Challenging: $g_q = 0.25$; $g_{DM} = 1$
  - Medium: $g_q = 0.375$; $g_{DM} = 1$
  - Optimistic: $g_q = 0.5$; $g_{DM} = 1$
  - DM-suppressed $g_q = 0.375$; $g_{DM} = 0.25$

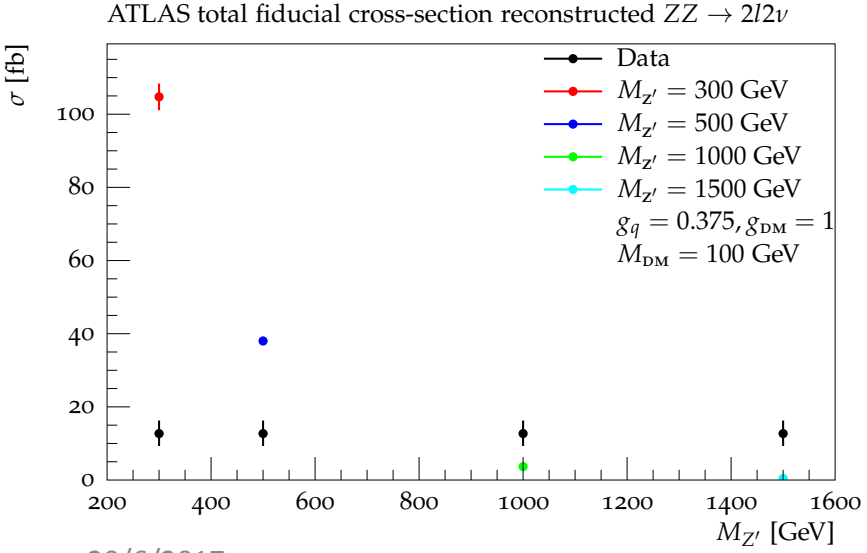
Data Comparisons

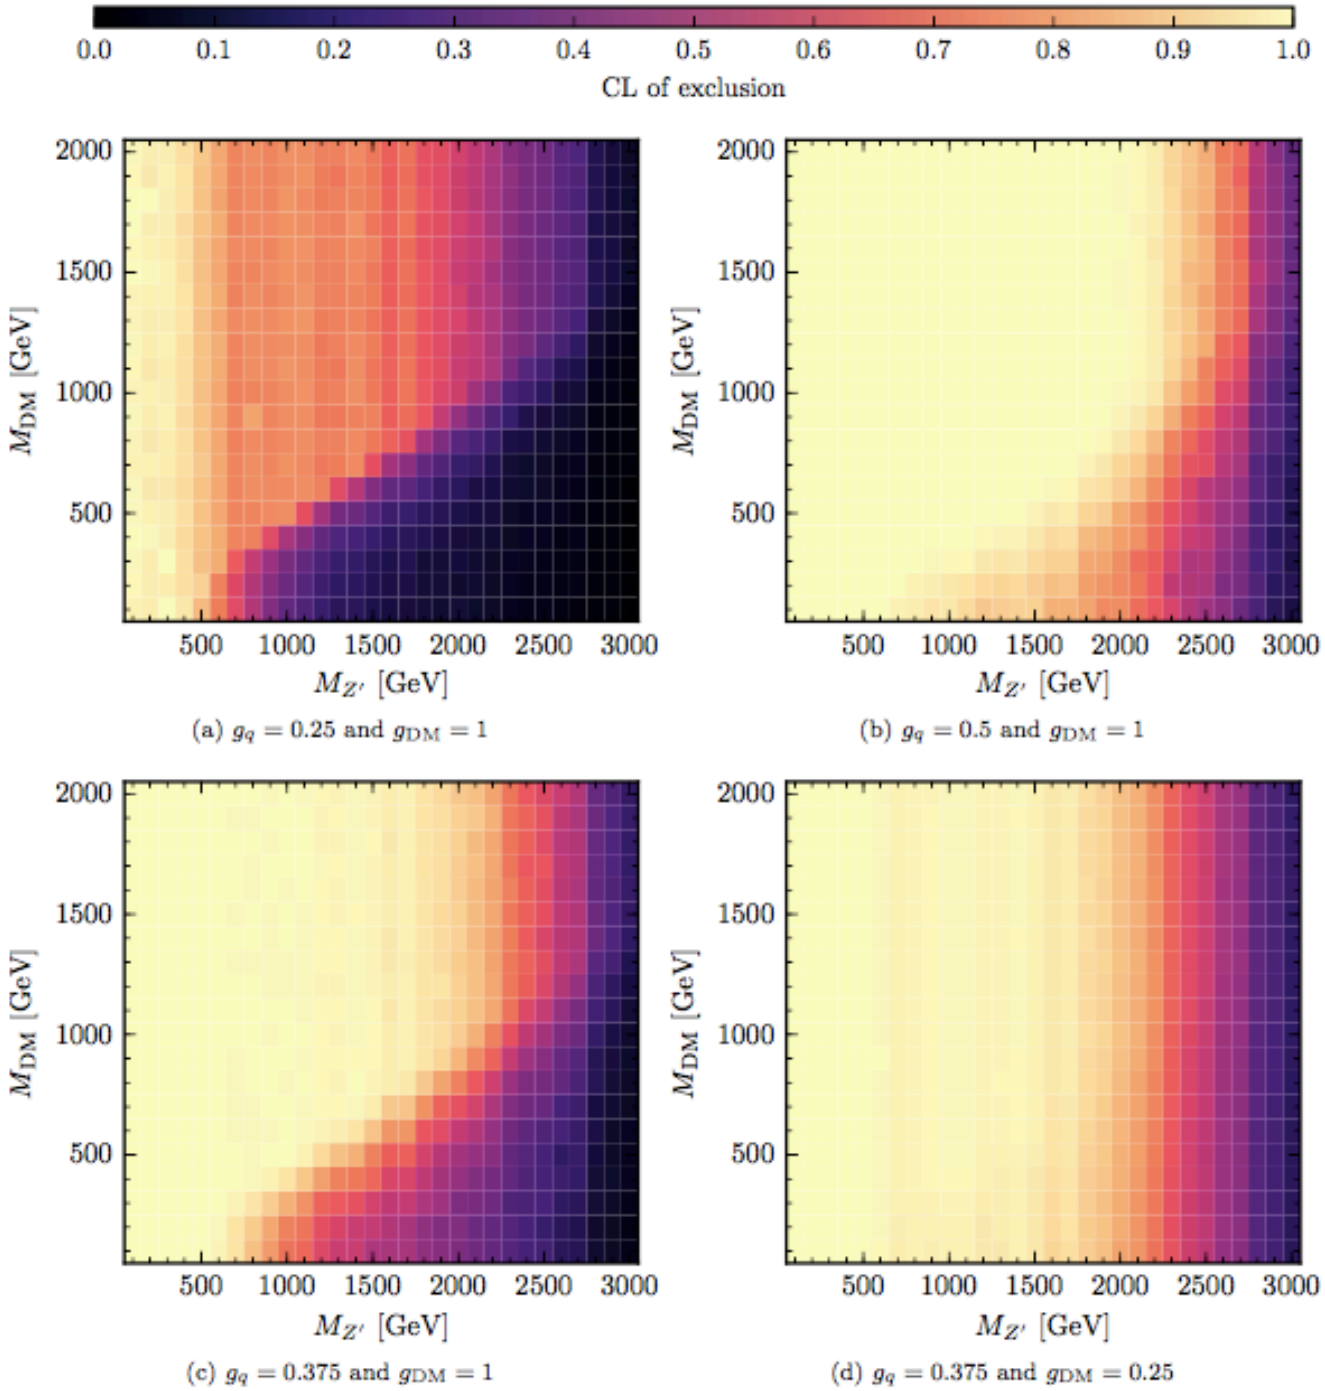




Data Comparisons





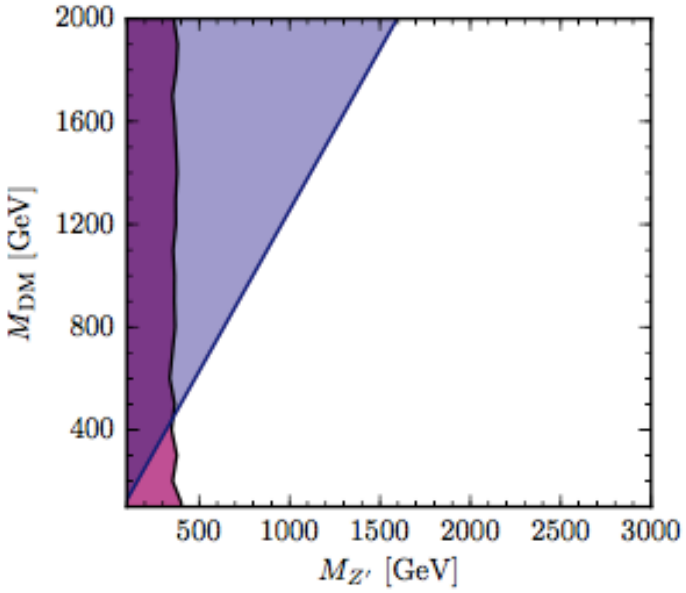


(a) $g_q = 0.25$ and $g_{\mathrm{DM}} = 1$

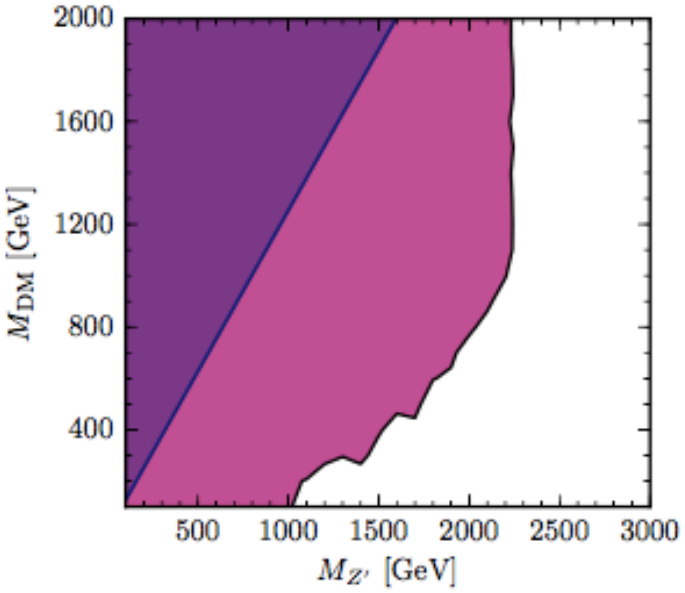
(b) $g_q = 0.5$ and $g_{\mathrm{DM}} = 1$

(c) $g_q = 0.375$ and $g_{\mathrm{DM}} = 1$

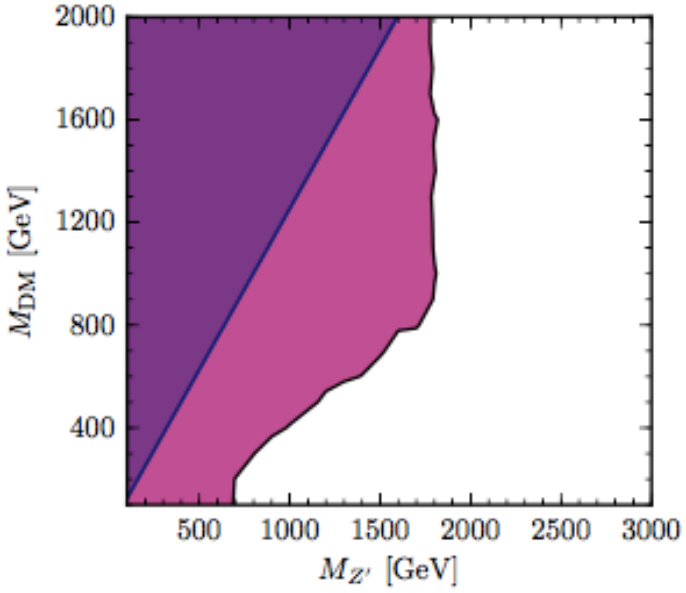
(d) $g_q = 0.375$ and $g_{\mathrm{DM}} = 0.25$



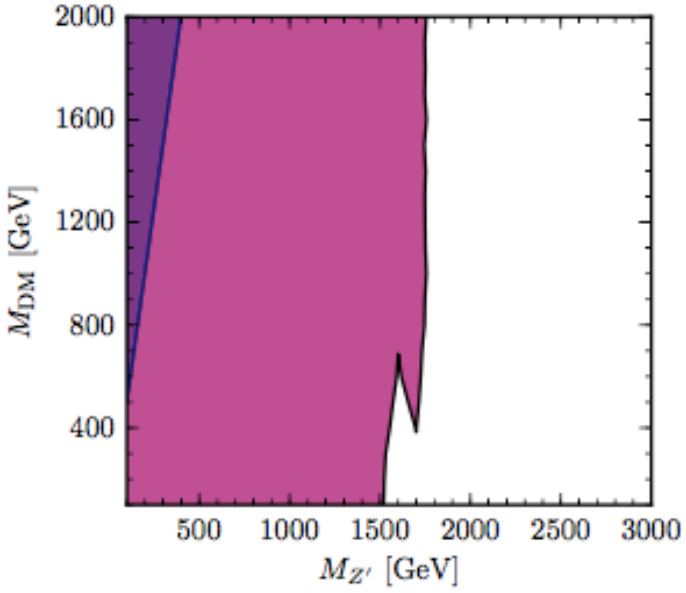
(a) $g_q = 0.25$ and $g_{\rm DM} = 1$



(b) $g_q = 0.5$ and $g_{\rm DM} = 1$



(c) $g_q = 0.375$ and $g_{\rm DM} = 1$



(d) $g_q = 0.375$ and $g_{\rm DM} = 0.25$

Low $M_{Z'}$, low coupling

- V+jets has unexpectedly good sensitivity at low $M_{Z'}$.
- How low in coupling g_{SM} does this go?
  - About 0.18

C. Donaldson (prelim.)

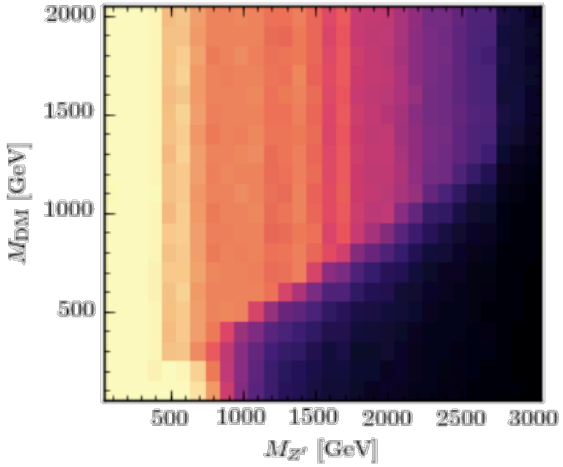


Figure 4: Exclusion heatmap for $g_q = 0.25$, $g_{DM} = 1.0$ from the CONTUR white paper.

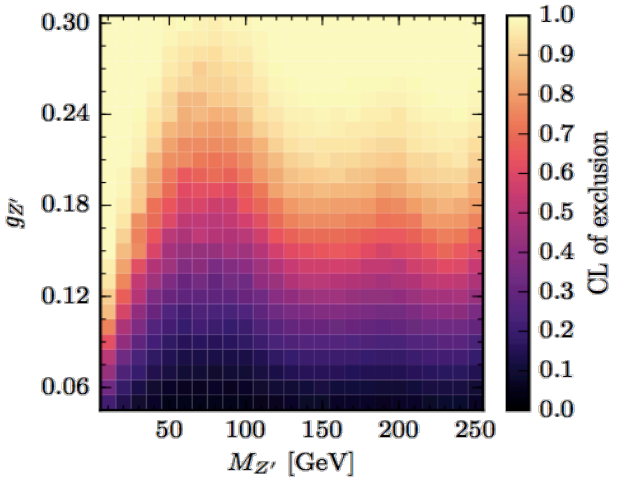

Figure 6: Exclusion heatmap for $M_{DM} = 600$ GeV and 500,000 events per .yoda file, using data from several 7 TeV and 8 TeV ATLAS and CMS analyses.

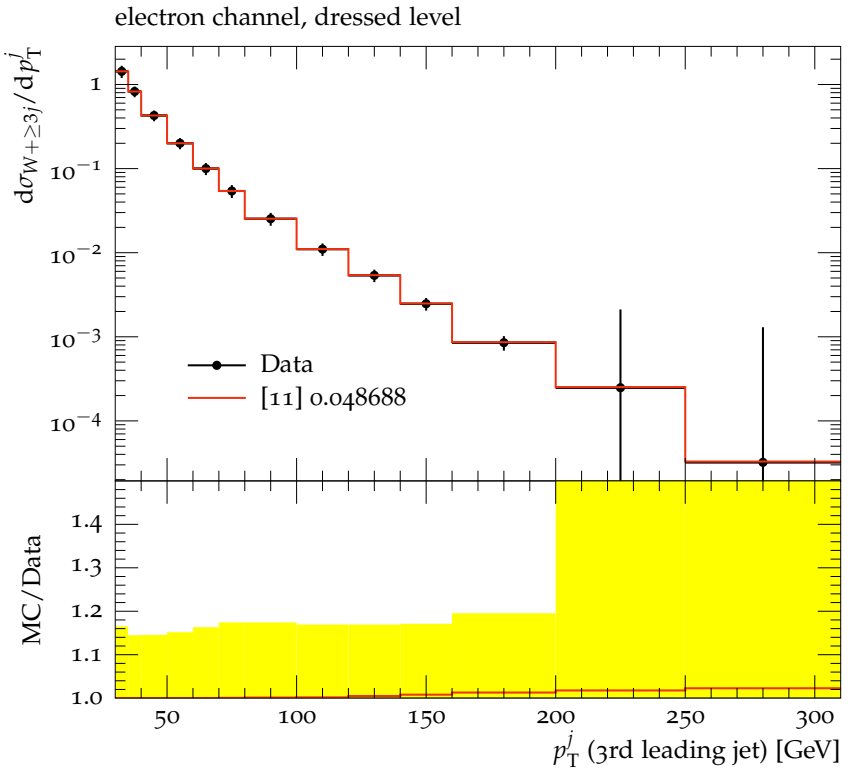
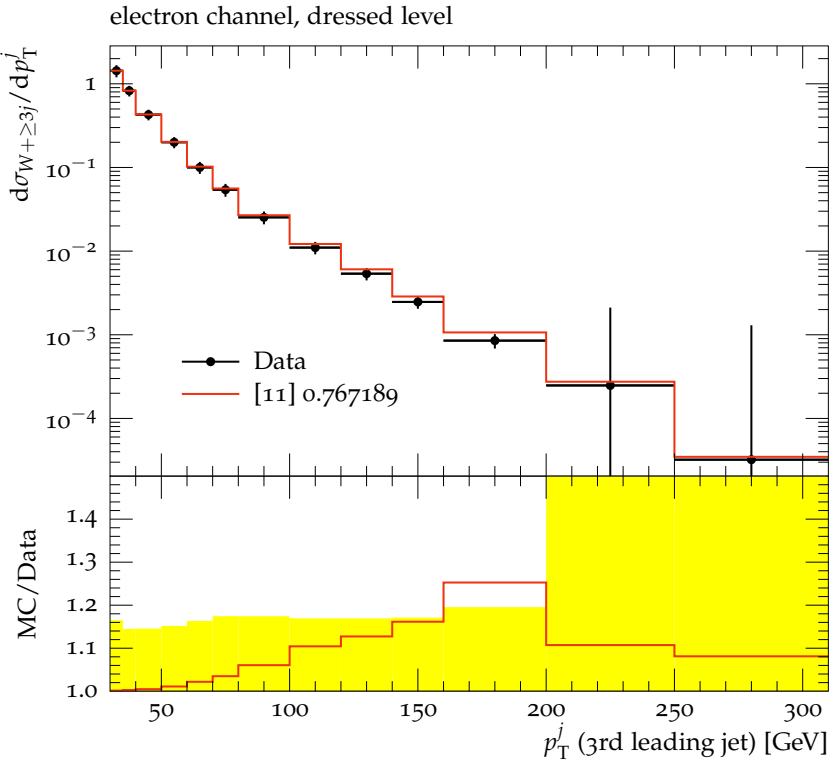
Look at “all flavours” model

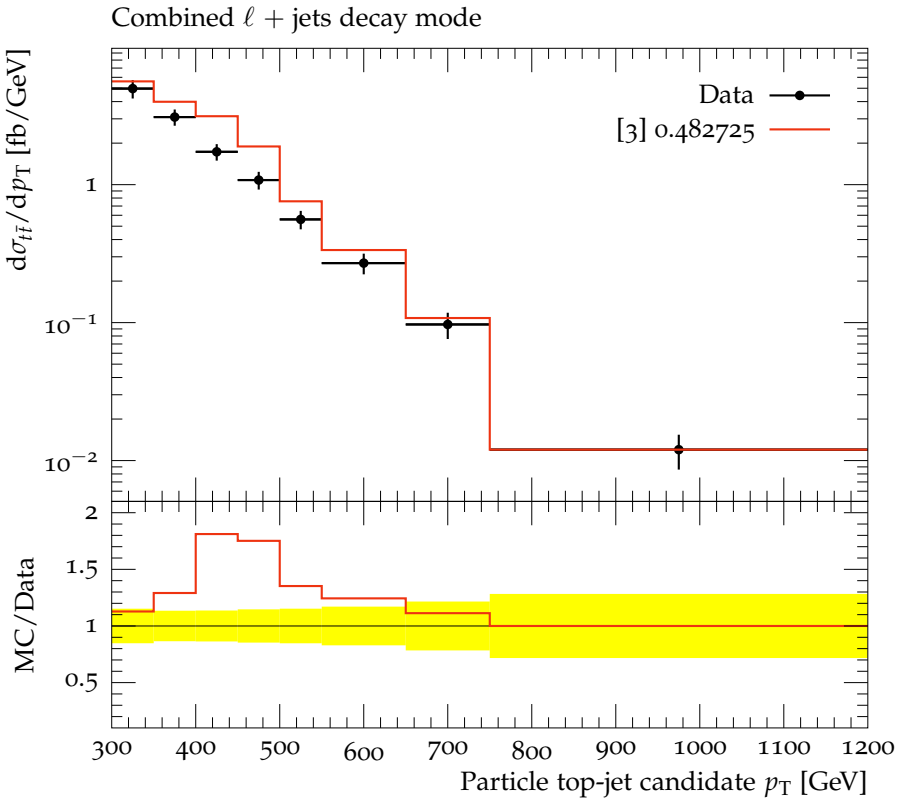
g_q = 0.375, M_{DM}=600 GeV, $M_{Z'}$=1 TeV (plots made in Les Houches…)





Look at “all flavours” model

g_q = 0.375, M_{DM}=600 GeV, $M_{Z'}$=1 TeV (plots made in Les Houches…)



Conclusions

- Particle-level measurements not only measure what is happening in our collisions, they constrain what is *not* happening.
- Limit-setting procedure developed; even with conservative treatment of correlations, limits are competitive with dedicated searches using comparable data-sets
- General framework developed:
  - consider all new processes in a given (simplified) model
  - consider all available final states. (e.g. V+jet shows previously unexamined sensitivity to the model considered)

Future work

- Highly scaleable to other models & new measurements – plan continuous rolling development
- Include (latest) Standard Model predictions and uncertainties directly
- Treat correlations better, where available
- See arXiv:1606.05296 (JHEP 2017 078) and references therein, and hepforge.org/contur
- We want your UFO files…
