Les Houches 2017

# Run 1 ATLAS+CMS Combination: Couplings

# Run 1 ATLAS+CMS Combination: Mass

- $m_H = 125.09 \pm 0.24$   
 $(\pm 0.21(\text{stat.}) \pm 0.11(\text{syst.}))$  GeV

# Run 2: Higgs is Still Here

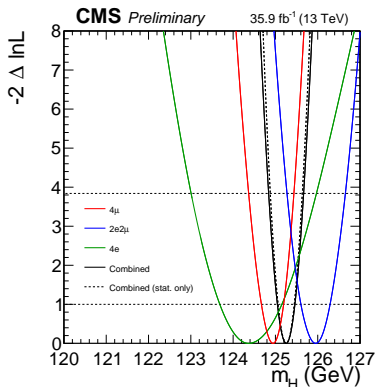

- Well beyond assessing statistical significance for discovery channels

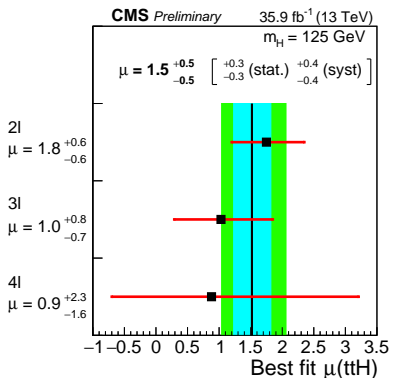

# Run 2: Higgs is Still Here

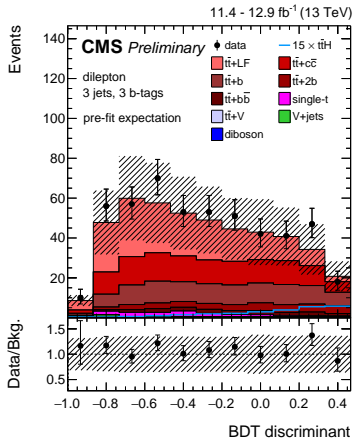

## Run 2: Higgs is Still Here

- Higgs mass measurement in muon channel competitive with Run 1 combination
- Calorimeter-related systematic uncertainties mean that most precise measurements in electron and photon channels will take more time

- Expected cross section increases by a factor of  $\sim 4$  from 8 to 13 TeV
- Results still consistent with Standard Model

- Modelling of  $t\bar{t}$ +heavy flavour crucial to  $t\bar{t}H$  measurements
- Interesting theoretical issues and related practical issues for MC production

- Two paths forward beyond the usual coupling fits and  $\mu$  values from Run 1
  - 1 Fiducial and Differential cross sections (typically unfolded to particle-level phase-space definitions)
  - 2 Simplified Template Cross Sections

# Fiducial and Differential Cross Sections

- Well established experience with unfolded QCD, Vector Boson, Top measurements
- Clear path forward with increased integrated luminosity
- Model (in)-dependence places constraints on event-level multivariate classifiers
- Trade-off between sensitivity and model dependence

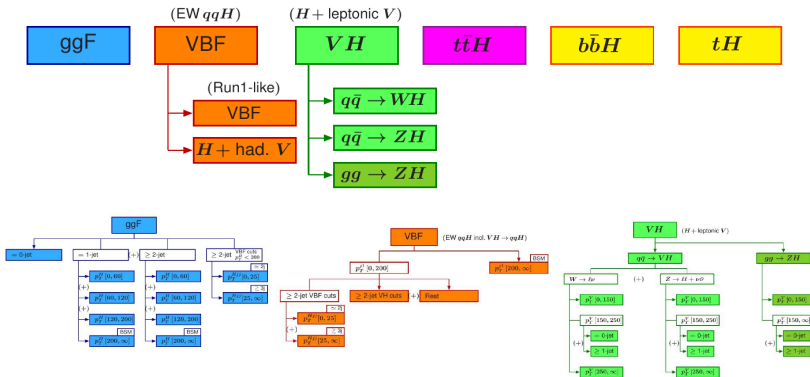

# Fiducial and Differential Cross Sections

- Fiducial and differential cross sections can be combined by defining phase space in terms of Higgs kinematics (requires assuming Standard Model decay kinematics)

# Simplified Template Cross Sections

- Finer-granularity categorization of Higgs production at truth level to better factorize theoretical input and uncertainties from reported experimental results
- Staged approach to scale with integrated luminosity

# Simplified Template Cross Sections: Stage 0 Results

**ATLAS Preliminary**  $m_H = 125.09$  GeV  
 $\sqrt{s} = 13$  TeV, 13.3 fb<sup>-1</sup> ( $\gamma\gamma$ ), 14.8 fb<sup>-1</sup> (ZZ)

- First results with “Stage 0” definitions
- Moving towards “Stage 1” with further splitting
- Some subtleties dealing with bins with limited sensitivity, strong correlations, non-Gaussian behaviour, etc

# Boosted Higgs Production

CMS-HIG-17-010

- Search for boosted  $H \rightarrow b\bar{b}$  production with jet substructure, selecting  $p_T^H > 450$  GeV
- May be one of the first channels explicitly sensitive to finite top mass effects, electroweak corrections, etc
