

gg to HH

LO with full heavy quark mass dependence

Glover, van der Bij '88, Plehn, Spira, Zerwas '96

$m_t \rightarrow \infty$ limit ("HEFT"):

Note:

HEFT strictly valid only for $\sqrt{\hat{s}} \ll 2m_t$ } \Rightarrow validity of HEFT limited to
 HH production threshold: $2m_H < \sqrt{\hat{s}}$ } $250 \text{ GeV} < \sqrt{\hat{s}} < 340 \text{ GeV}$

gg to HH

LO with full heavy quark mass dependence

Glover, van der Bij '88, Plehn, Spira, Zerwas '96

$m_t \rightarrow \infty$ limit ("HEFT"):

Note:

HEFT strictly valid only for $\sqrt{\hat{s}} \ll 2m_t$ } \Rightarrow validity of HEFT limited to
 HH production threshold: $2m_H < \sqrt{\hat{s}}$ } $250 \text{ GeV} < \sqrt{\hat{s}} < 340 \text{ GeV}$

"Born-improved HEFT": rescale by $\mathcal{M}^{LO}(m_t) / \mathcal{M}_{\text{HEFT}}^{LO}$

NLO in Born-improved HEFT Dawson, Dittmaier, Spira '98 (HPAIR) $K \simeq 2$

- supplemented with $1/m_t$ expansion: ($\pm 10\%$)

Grigo, Hoff, Melnikov, Steinhauser '13, '15 ; Degrassi, Giardino, Gröber '16

- full mass dependence in NLO **-10%**
 real radiation ("FTapprox")

Frederix, Hirschi, Mattelaer, Maltoni, Torrielli, Vryonidou, Zaro '14;
 Maltoni, Vryonidou, Zaro '14

gg to HH

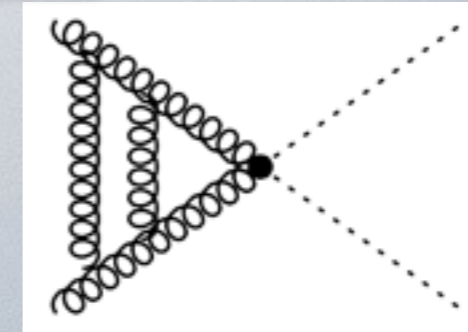

NNLO in $m_t \rightarrow \infty$ limit: +20%

- **total xs NNLO** De Florian, Mazzitelli '13
- **including all matching coefficients** Grigo, Melnikov, Steinhauser '14
- **supplemented with $1/m_t$ expansion:** Grigo, Hoff, Steinhauser '15
- **soft gluon resummation NNLL matched to NNLO** De Florian, Mazzitelli '15 **+9%**
- **differential NNLO** De Florian, Grazzini, Hanga, Kallweit, Lindert, Maierhöfer, Mazzitelli, Rathlev '16

gg to HH

NNLO in $m_t \rightarrow \infty$ limit: **+20%**

- **total xs NNLO** De Florian, Mazzitelli '13
- **including all matching coefficients** Grigo, Melnikov, Steinhauser '14
- **supplemented with $1/m_t$ expansion:** Grigo, Hoff, Steinhauser '15
- **soft gluon resummation NNLL matched to NNLO** De Florian, Mazzitelli '15 **+9%**
- **differential NNLO** De Florian, Grazzini, Hanga, Kallweit, Lindert, Maierhöfer, Mazzitelli, Rathlev '16

NLO calculation with full top mass dependence

Borowka, Greiner, GH, Jones, Kerner, Schlenk, Schubert, Zirke '16

4 independent scales s_{12} , s_{23} , m_H , m_t
all integrals calculated **numerically** with
SecDec

Borowka, GH, Jones, Kerner, Schlenk, Zirke '15

Borowka, GH, Jahn, Jones, Kerner, Schlenk, Zirke '17

- q_T resummation **NLL+NLO**

Ferrera, Pires '16

calculation: building blocks

- amplitude generation with **GoSam-2loop** (python, QGRAF, FORM)
[N.Greiner, S.Jahn, S.Jones, M.Kerner]
- amplitude reduction with **Reduze** [C. Studerus, A. v.Manteuffel]
- non-planar integrals computed mostly without reduction
- **all** integrals calculated numerically with **SecDec**
- total number of integrals:
 - before reduction: ~ 10000 , after reduction ~ 330 ,
after sector decomposition 11244 (3086 non-planar)
 - used finite basis for planar integrals

- real radiation:

(a) GoSam-1L + Catani-Seymour dipole subtraction

(b) GoSam-1L + POWHEG

numerical evaluation of multi-loop integrals (advert break)

new

top mass effects

total cross sections at 14 TeV

$$\mu_0 = m_{HH}/2$$

	$\sigma_{\text{LO}} [\text{fb}]$	$\sigma_{\text{NLO}} [\text{fb}]$	$\sigma_{\text{NNLO}} [\text{fb}]$
HEFT	$17.07^{+30.9\%}_{-22.2\%}$	$31.93^{+17.6\%}_{-15.2\%}$	$37.52^{+5.2\%}_{-7.6\%}$
B-i. HEFT	$19.85^{+27.6\%}_{-20.5\%}$	$38.32^{+18.1\%}_{-14.9\%}$	
FT _{approx}	$19.85^{+27.6\%}_{-20.5\%}$	$34.26^{+14.7\%}_{-13.2\%}$	
full m_t dep.	$19.85^{+27.6\%}_{-20.5\%}$	$32.91^{+13.6\%}_{-12.6\%}$	

PDF4LHC15_nlo_30_pdfas

$m_H=125 \text{ GeV}, m_t=173 \text{ GeV}$

uncertainties: $\mu_{R,F} \in [\mu_0/2, 2\mu_0]$ (7-point variation)

$$\sigma'_{\text{NNLL}} = \sigma_{\text{NNLL}} + \delta_t \sigma_{\text{NLO}}^{\text{HEFT}} = 39.64^{+4.4\%}_{-6.0\%}$$

Higgs boson pair invariant mass

for large invariant masses:

Born-improved NLO HEFT overestimates by about 50%, FTapprox by about 40%
(at 14 TeV, worse at 100 TeV)

top quark loops resolved \longrightarrow HEFT has wrong scaling behaviour at high energies

top mass effects: II. distributions

transverse momentum of one of the Higgs bosons

Born-improved NLO HEFT very poor at large p_T

scaling behaviour

$\frac{d\hat{\sigma}}{dm_{hh}} \sim m_{hh}^{-3}$ i.e. partonic cross section scales as \hat{s}^{-1}

HEFT approximation: $\frac{d\hat{\sigma}}{dm_{hh}} \sim m_{hh}$ i.e. $\hat{\sigma} \sim \hat{s}$

similar for H+jet: [Greiner, Höche, Luisoni, Schönherr, Winter '16]

$\frac{d\hat{\sigma}}{dp_{T,h}} \sim 1/p_{T,h}^a$ with $a = 2(\text{full}), a = 1(\text{HEFT})$

NLO-improved NNLO HEFT

NNLO HEFT:

De Florian, Grazzini, Hanga, Kallweit, Lindert, Maierhöfer, Mazzitelli, Rathlev, arXiv:1606.09519

what we did in arXiv:1608.04798:

$$\frac{d\sigma^{\text{NLO-i.NNLO HEFT}}}{dm_{hh}} = \frac{d\sigma_{\text{NLO}}}{dm_{hh}} \times \frac{d\sigma_{\text{NNLO}}^{\text{HEFT}}/dm_{hh}}{d\sigma_{\text{NLO}}^{\text{HEFT}}/dm_{hh}}$$

bin-by-bin rescaling at observable level by NNLO HEFT K-factor

combination with parton showers

GH, S.Jones, M.Kerner, G.Luisoni, E.Vryonidou 1703.09252

- avoid evaluation of two-loop amplitude for each phase space point
- two-loop amplitude depends only on \hat{s}, \hat{t} (m_t, m_H fixed)
→ construct 2-dim grid
- variable transformation to achieve more uniform distribution

$$x = f(\beta(\hat{s})), \quad c_\theta = |\cos \theta| = \left| \frac{\hat{s} + 2\hat{t} - 2m_H^2}{\hat{s}\beta(\hat{s})} \right| \quad \beta(\hat{s}) = \sqrt{1 - 4m_H^2/\hat{s}}$$

- choose f according to cumulative distribution of phase space points
- use *SciPy* package for interpolation [Clough, Tocher]

combination with parton showers

combination with both POWHEG and MadGraph5_aMC@NLO

- different matching schemes
- same shower (Pythia 8.2)
- no Higgs decays, no hadronisation

combination with parton showers

combination with both POWHEG and MadGraph5_aMC@NLO

- different matching schemes
- same shower (Pythia 8.2)
- no Higgs decays, no hadronisation

POWHEG User-Process-V2/ggHH

**2-loop results
publicly available,
easy to use!**

combination with parton showers

combination with both POWHEG and MadGraph5_aMC@NLO

- different matching schemes
- same shower (Pythia 8.2)
- no Higgs decays, no hadronisation

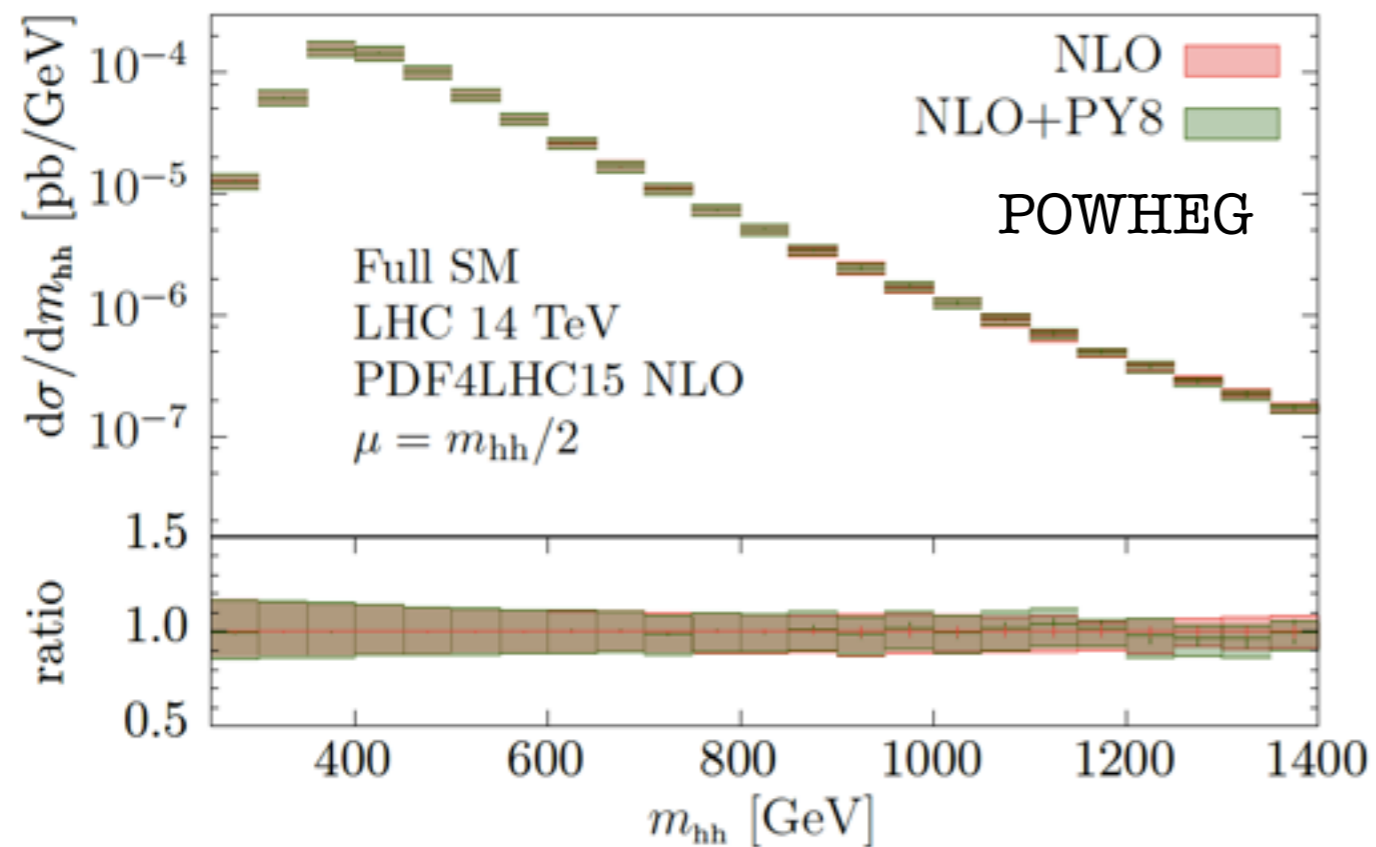

POWHEG User-Process-V2/ggHH

**2-loop results
publicly available,
easy to use!**

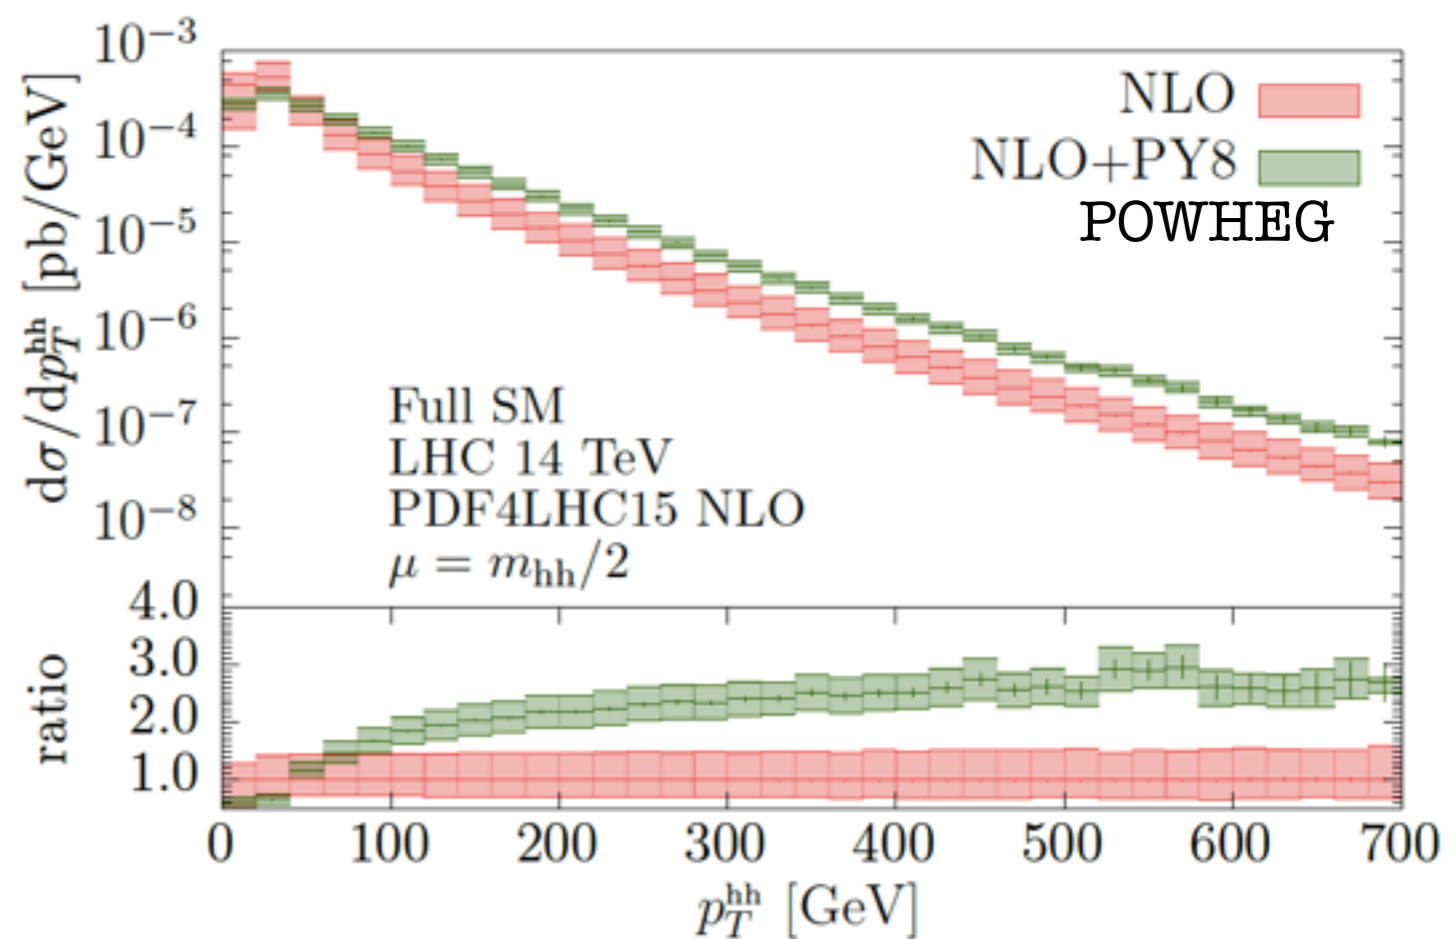

combination with Herwig⁷.1 and Sherpa is on the way

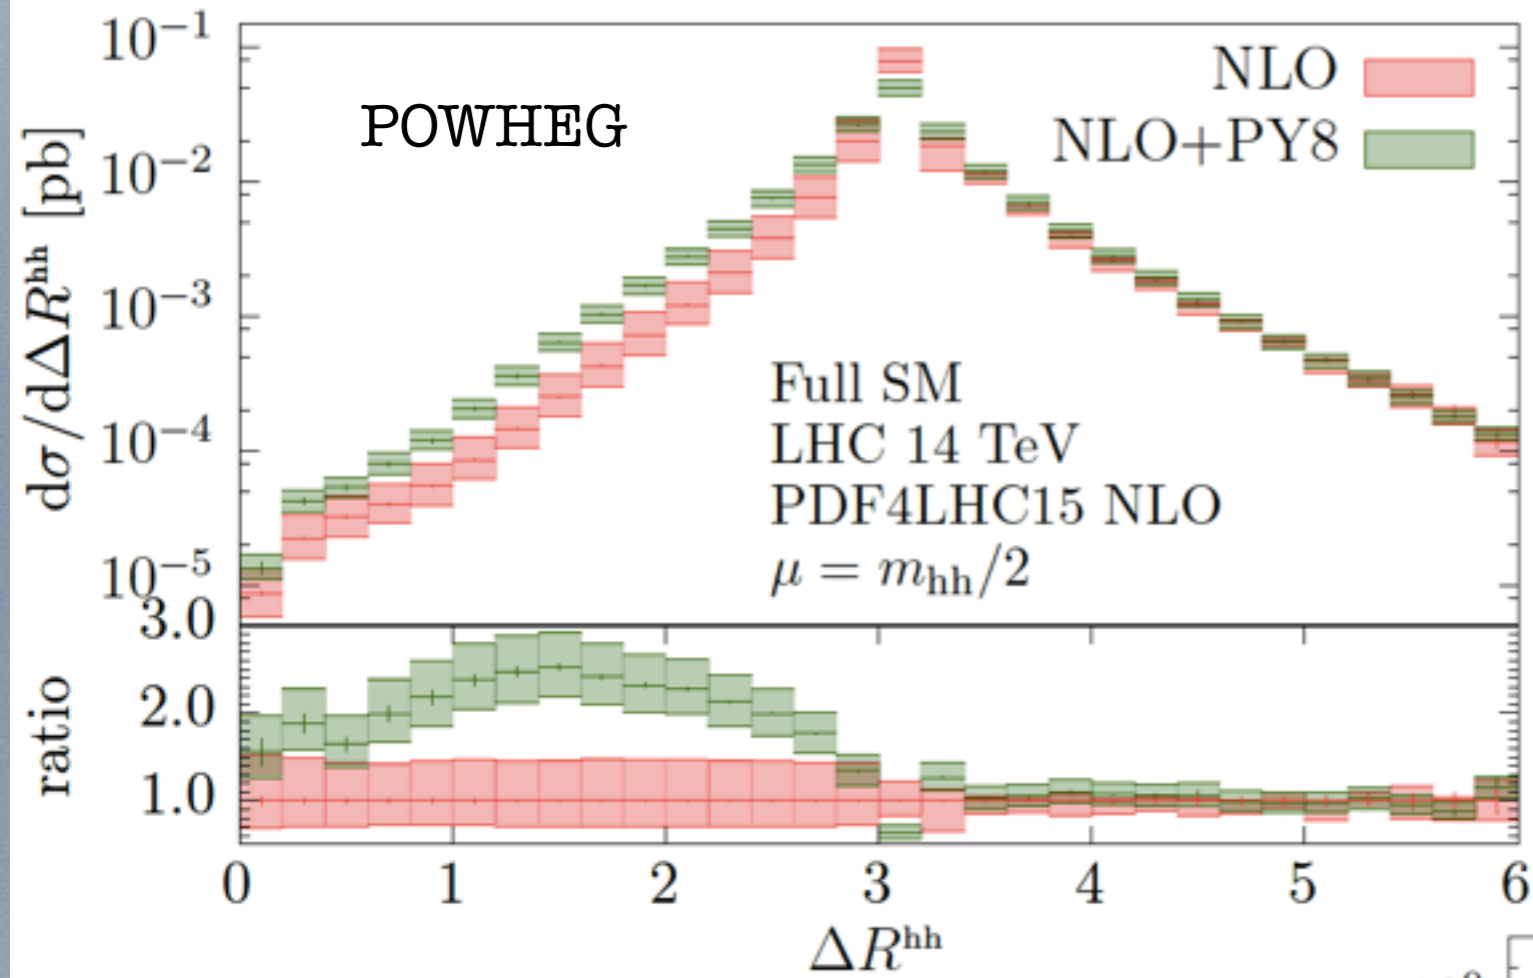

compare fixed order and showered results

large shower effects on p_T^{hh}
 expected because fixed order is
 first non-trivial order

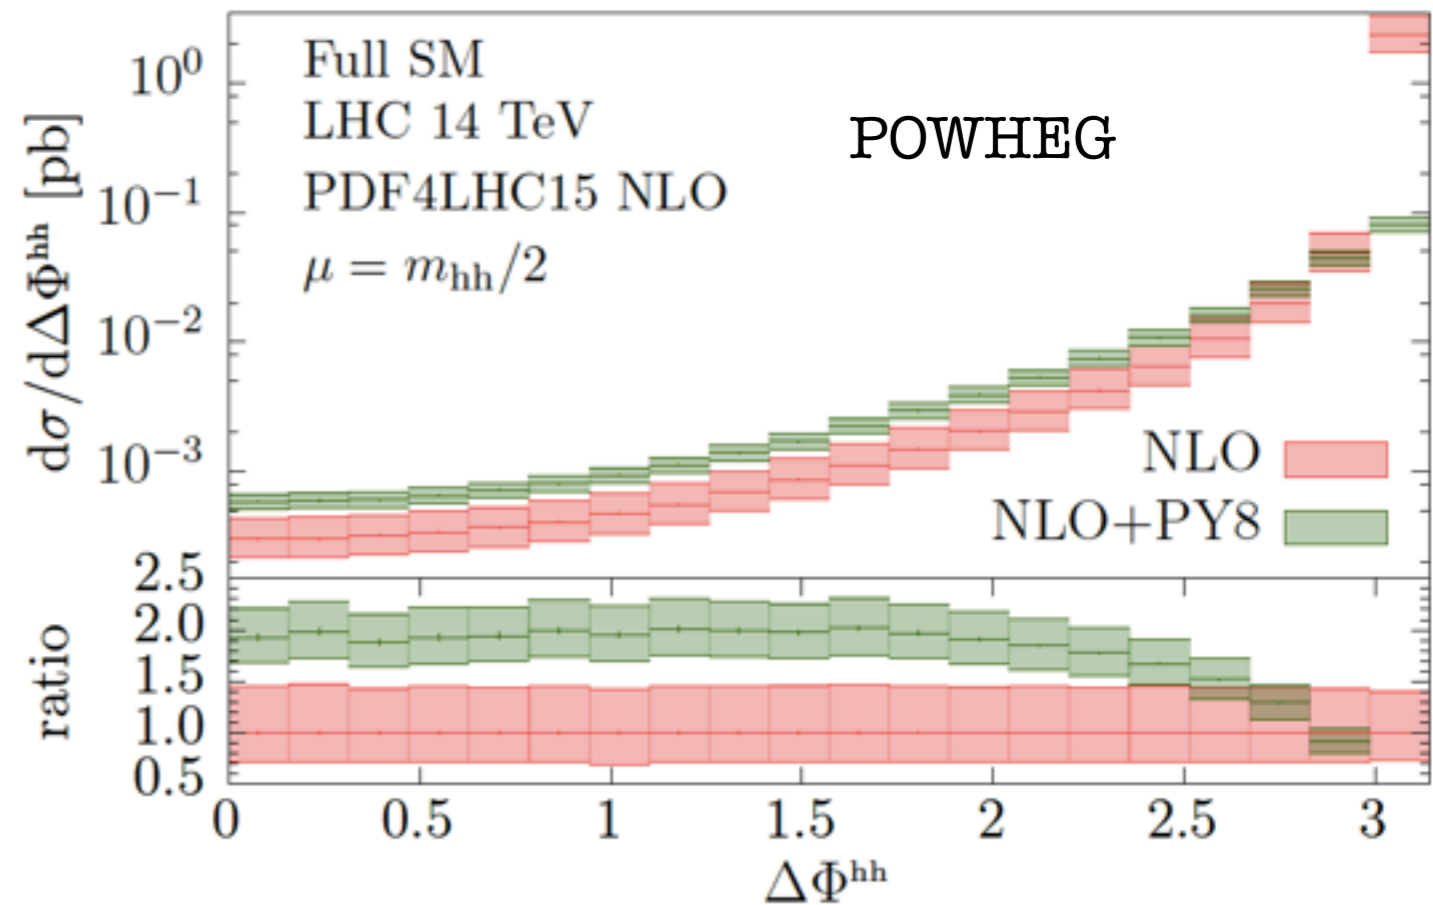

compare fixed order and showered results

$$\Delta R^{hh} = \sqrt{(\eta_1 - \eta_2)^2 + (\Phi_1 - \Phi_2)^2}$$

for $\Delta R^{hh} < \pi$ fixed order is only
“LO accurate”

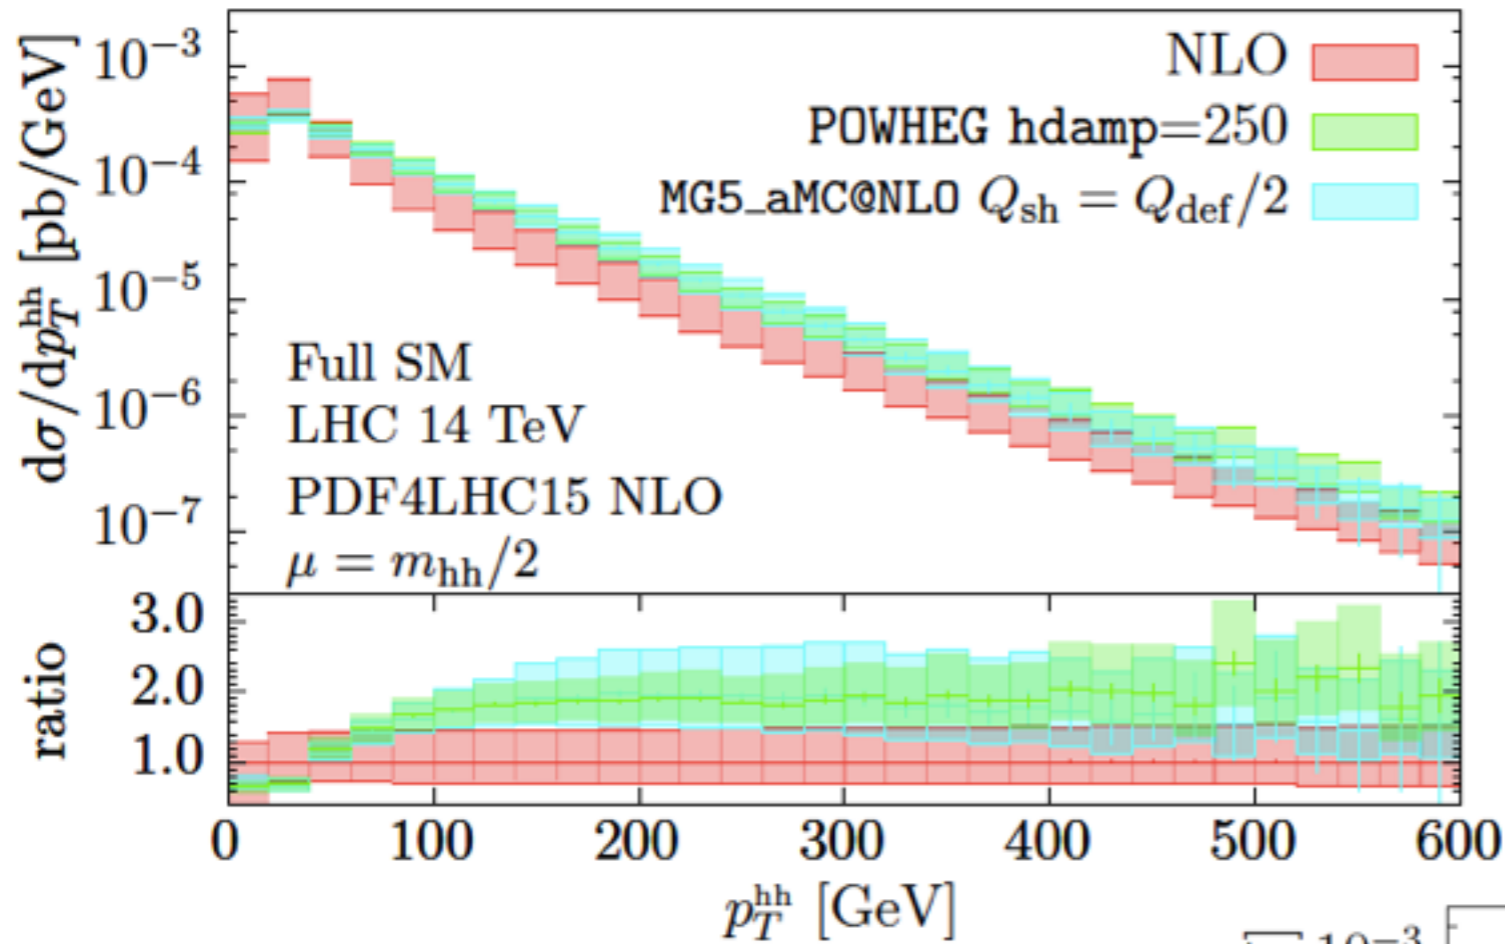

dependence on shower starting scale

hdamp limits amount of exponentiated hard radiation

$$R_{\text{sing}} = R \times F,$$

$$R_{\text{reg}} = R \times (1 - F)$$

$$F = \frac{h^2}{(p_T^{\text{hh}})^2 + h^2}$$

compare different approximations

shower effects large but order(s) of magnitude smaller than difference to Born-improved HEFT

Summary

- Born-improved HEFT approximation fails to describe tails of distributions
- FTapprox does a decent job for distributions/regions dominated by real radiation
- mass effects more important than shower effects
- **numerical** methods for 2-loop integrals can prove very useful in cases where analytic results are not available

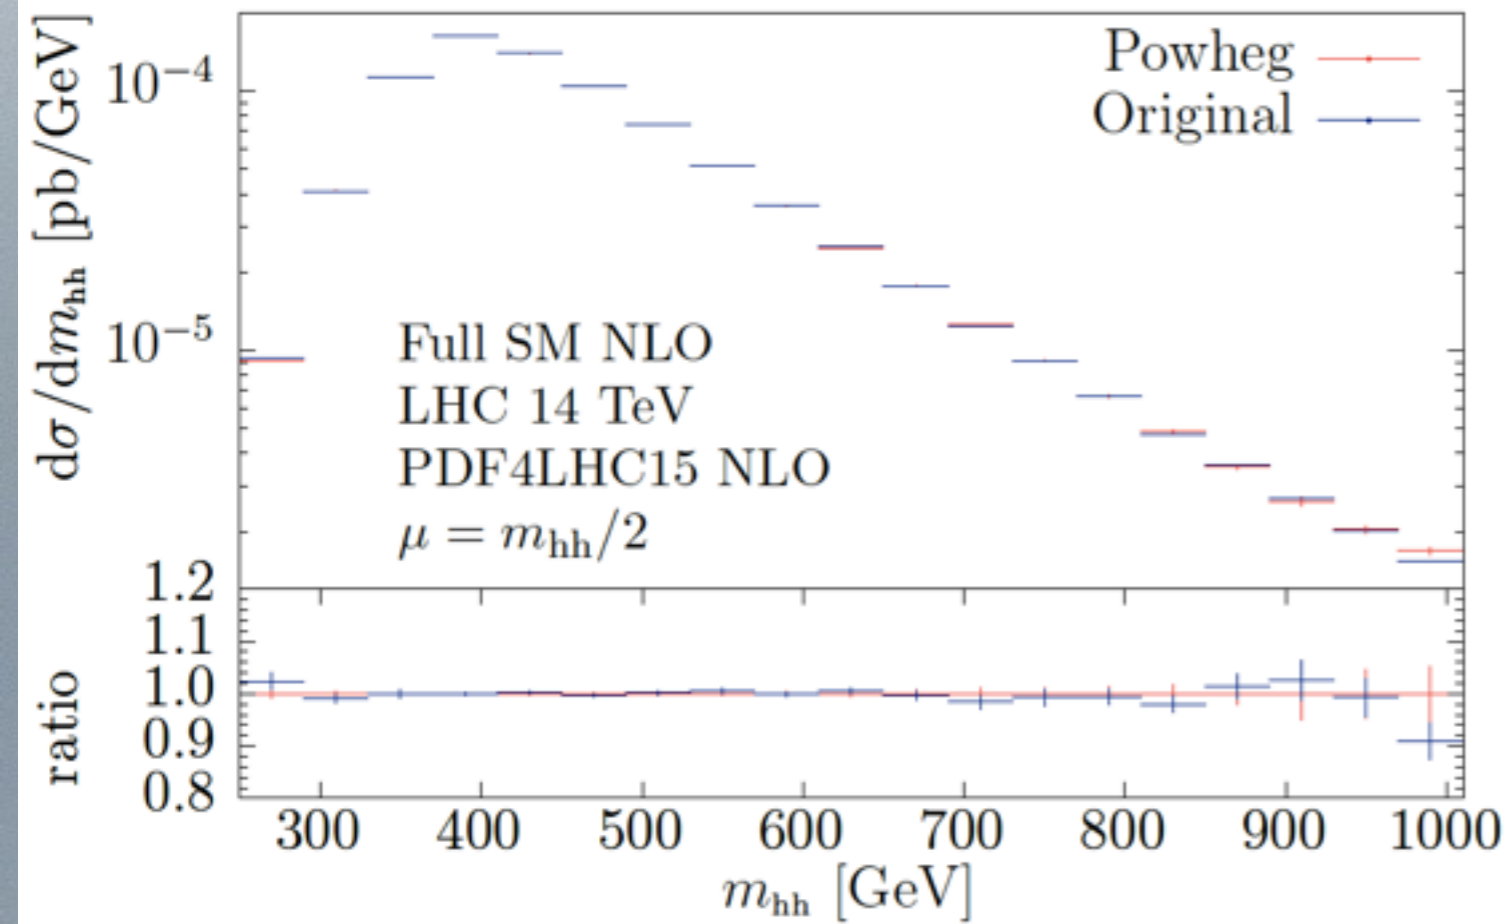

BACKUP SLIDES

grid validation

“NNLO” effects (HEFT)

hdamp limits amount of exponentiated hard radiation

$$R_{\text{sing}} = R \times F,$$

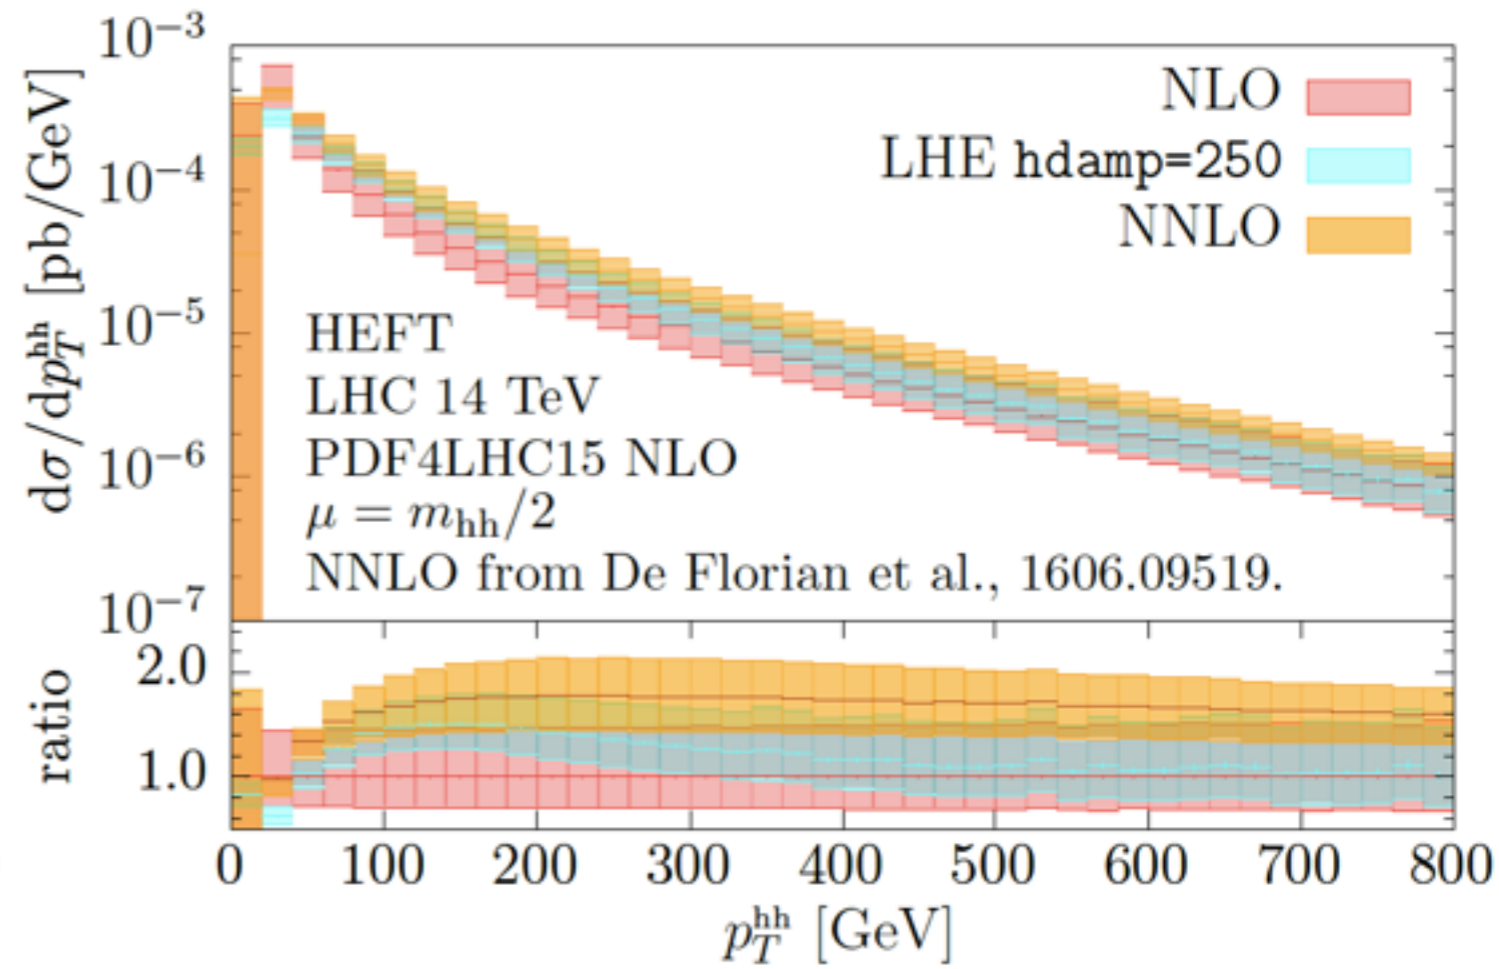

$$R_{\text{reg}} = R \times (1 - F)$$

$$F = \frac{h^2}{(p_T^{hh})^2 + h^2}$$

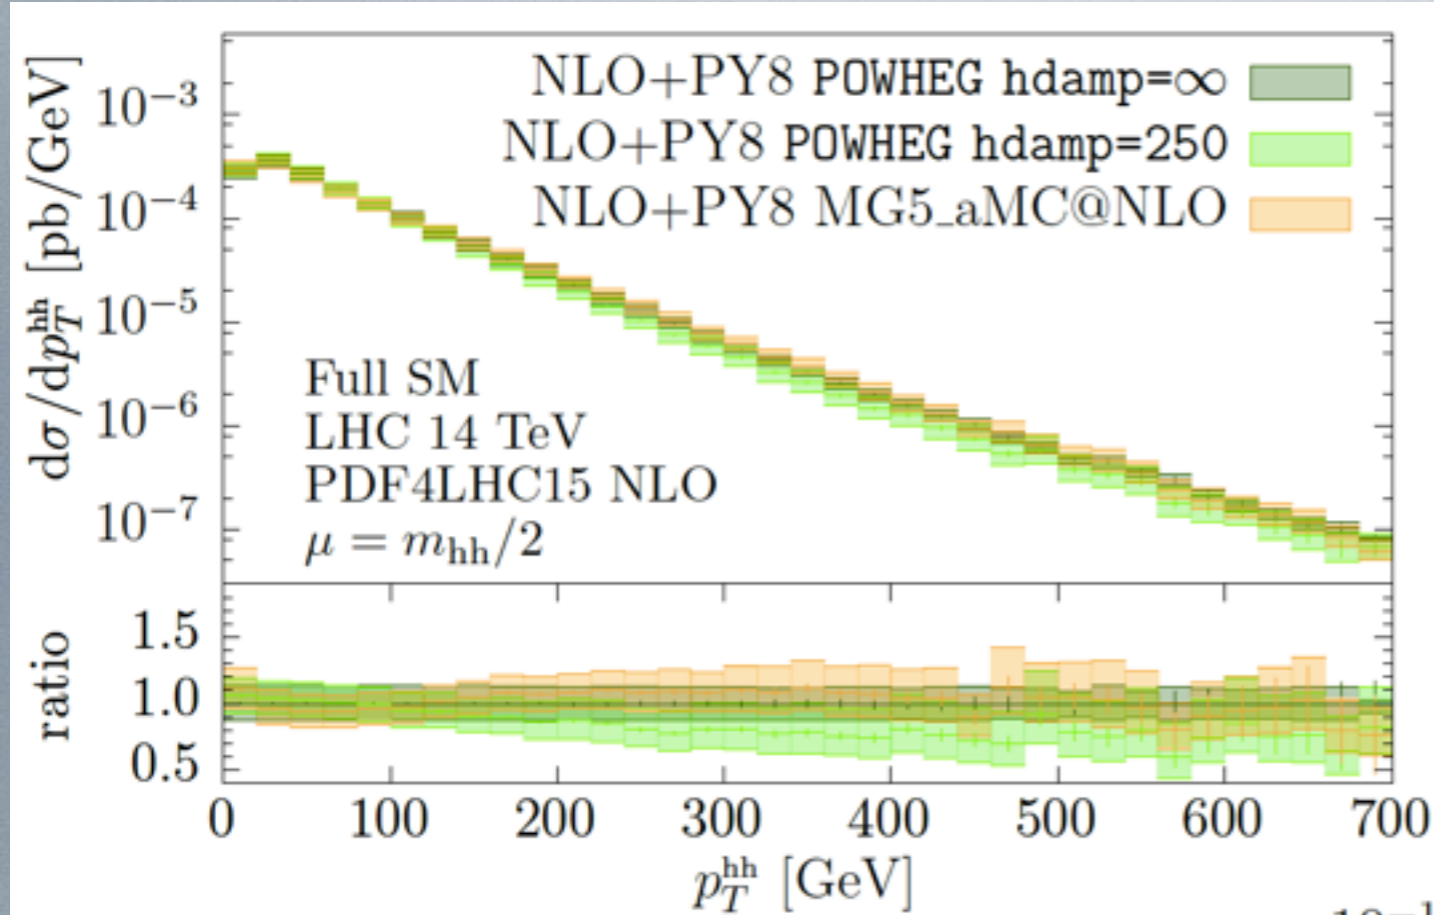

basic HEFT approximation

LHE: Les Houches event level

default hdamp= ∞ close to NNLO
in the tail

compare POWHEG and MG5_aMC@NLO

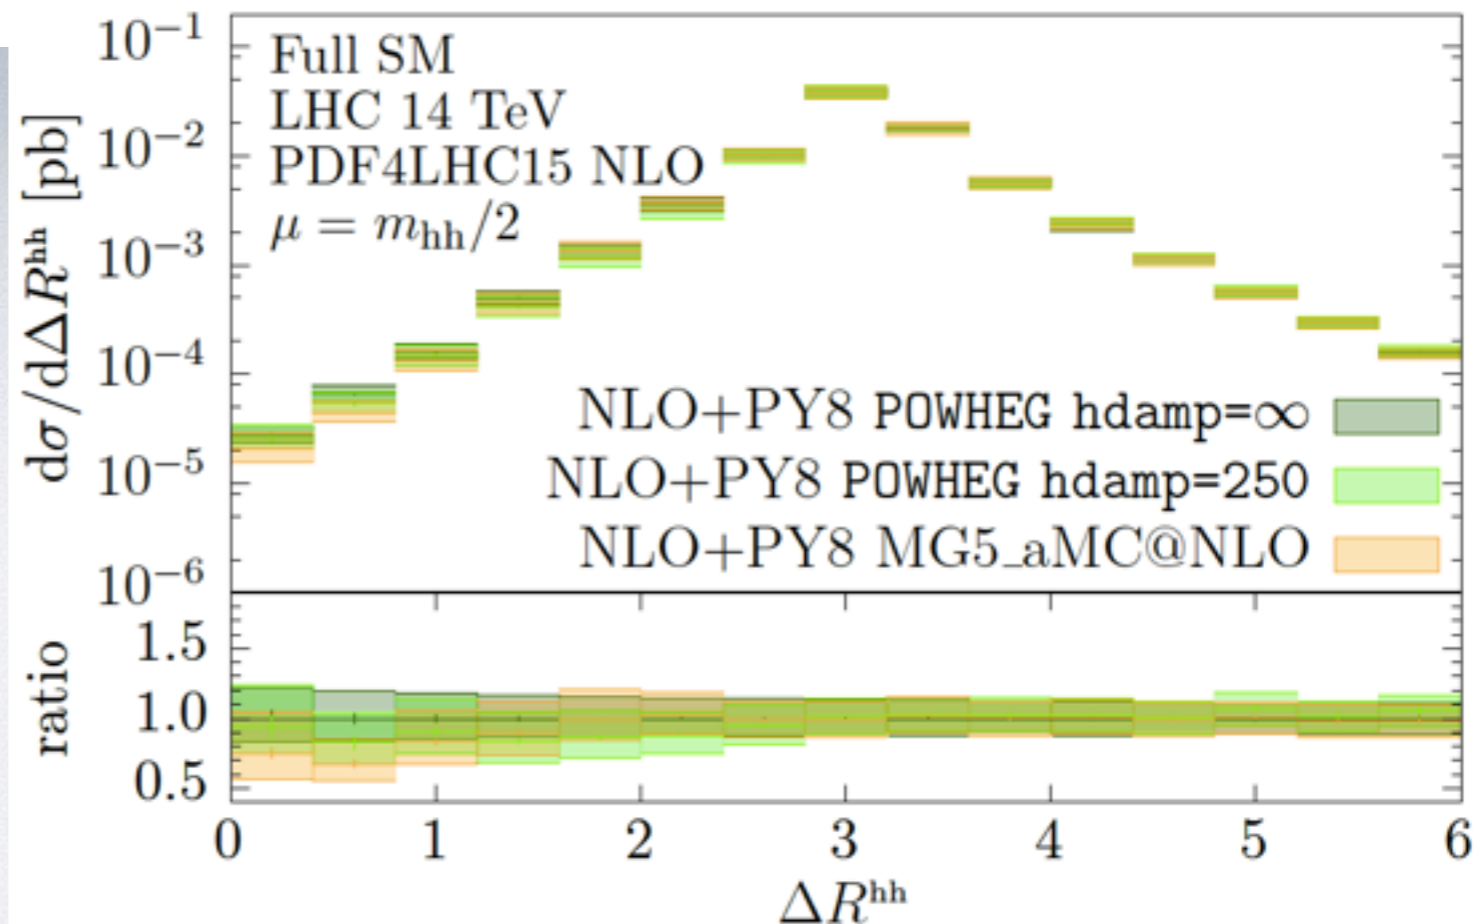

$$R_{\text{sing}} = R \times F,$$

$$R_{\text{reg}} = R \times (1 - F)$$

$$F = \frac{h^2}{(p_T^{\text{hh}})^2 + h^2}$$

$h=hdamp$ limits amount of exponentiated hard radiation
 default $hdamp=\infty$

matching uncertainties small

variation of triple Higgs coupling

$$\lambda = \lambda_{BSM} / \lambda_{SM}$$

cross section has a minimum around $\lambda = 2$ due to destructive interference between diagrams containing λ and box-type diagrams

variation of triple Higgs coupling

distributions have discriminating power

full analysis requires inclusion of other operators, e.g. $t\bar{t}hh$ coupling
